

Wireless Broadband Router User's Manual

(For SOHO Users)

This equipment has been tested and found to comply with the limits for a Class B digital device, pursuant to part 15 of the FCC rules. These limits are designed to provide reasonable protection against harmful interference in a residential installation. This equipment generates, uses and can radiate radio frequency energy and, if not installed and used in accordance with the instructions, may cause harmful interference to radio communications. However, there is no guarantee that interference will not occur in a particular installation. If this equipment does cause harmful interference to radio or television reception, which can be determined by turning the equipment off and on, the user is encouraged to try to correct the interference by one or more of the following measures:

- Reorient or relocate the receiving antenna.
- Increase the separation between the equipment and receiver.
- Connect the equipment into an outlet on a circuit different from that to which the receiver is connected.
- Consult the dealer or an experienced radio/TV technician for help.

You are cautioned that changes or modifications not expressly approved by the party responsible for compliance could void your authority to operate the equipment.

FCC RF Radiation Exposure Statement:

1. This Transmitter must not be co-located or operating in conjunction with any other antenna or transmitter.
2. This equipment complies with FCC RF radiation exposure limits set forth for an uncontrolled environment. This equipment should be installed and operated with a minimum distance of 20 centimeters between the radiator and your body.

1. Introduction

Thank you for purchasing the Wireless 11g Broadband Router. This Wireless Broadband Router, IEEE802.11g standard compliant, is a high quality and reliable Internet routing and security device, enables multiple users to share the Broadband Internet connection with or without wires through a Cable or DSL modem. Simply install the router, connect to Cable/DSL modem, and surf Internet without extra efforts. Acting as a 10/100Mbps 4-port Ethernet switch as well, the router, with all ports supporting MDI/MDIX, allows you to use CAT5 cable to uplink to other routers/switches.

The Wireless 11g Broadband Router is featured with advanced security technology, supporting WEP, WPA-PSK, WPA (Wi-Fi Protected Access) TKIP/AES and RADIUS. With the router, your network is armed with the highest levels of protection. The Router provides a total solution for the Small and Medium-sized Business (SMB) and the Small Office/Home Office (SOHO) markets, giving you an instant network today, and the flexibility to handle tomorrow's expansion and speed.

1.1 Features

Internet Access Features

- Shared Internet Access: All users on the LAN or WLAN can access the Internet through the Wireless Router, using only a single external IP address. The local (invalid) IP addresses are hidden from external sources. This process is called NAT (Network Address Translation).
- DSL and cable modem Support: The Wireless Router has a 10/100BaseT Ethernet WAN port for connecting a DSL or cable modem. All popular DSL and cable modems are supported.
- PPPoE and PPTP Support: The Internet (WAN port) connection supports PPPoE (PPP over Ethernet) and PPTP (Point-to-Point Tunneling Protocol), as well as "Direct Connection" type services.
- Fixed or Dynamic IP Address: On the Internet (WAN port) connection, the Wireless Router supports both Dynamic IP address (IP address is allocated on connection) and Fixed IP address.

Advanced Internet Functions

- Conferencing & Telephony Applications: Internet Telephony and Conferencing applications are supported.
- DMZ: One PC on your local LAN can be configured to allow unrestricted 2-way communication with Servers or individual users on the Internet.
- URL Filter: Use the URL Filter to block access to undesirable Web sites by LAN users, or Wireless LAN users.
- Internet Access Log: This feature is used to verify which Internet connections have been made.

Wireless Features

- Compliant with IEEE 802.11g standard.
- Up to 54Mbps data transfer rates (wireless)
- Backward compatible with IEEE802.11b (at 11Mbps)
- WEP Support: Support 64/128 bit WEP (Wired Equivalent Privacy) encryption.
- WPA Support: Support WPA-PSK Pass Phrase, WPA G-Rekey and WPA TKIP/AES Data Encryption.
- Access Control: This feature ensures that only access Wireless Stations that can access your LAN.
- Simple Configuration: All default settings can be changed easily.
- Supports Wireless Distribution System (WDS)

LAN Features

- 4-Port Ethernet switch : The Wireless Router provides 4 10/100BaseT switching ports
- DHCP Server Support: This feature provides a dynamic IP address to PCs and other devices upon request. The Wireless Router can act as a DHCP Server for devices on your local LAN and WLAN.
- Multi Segment LAN Support: This feature is enabled through Wireless Router's RIP (Routing Information Protocol) and build-in static routing table.

Configuration and Management

- Easy Setup: Users allow to configure Wireless Router from anywhere on the LAN or WLAN via WEB browser.
- Remote Management: The Wireless Router can be managed from any PC on the LAN.
- UPnP Support: Universal Plug and Play feature. UPnP is supported by Windows ME or later.

Security Features

- Password Protected Configuration: Optional password protection is provided to prevent unauthorized users from modifying the configuration data and settings.
- Wireless LAN Security: Supports 64/128 bit WEP Encryption, WPA-PSK, WPA TKIP/AES, RADIUS Server.
- NAT Protection: This feature allows all LAN users to share a single IP address and all users' IPs are hidden. From the external viewpoint, there is no network only Wireless Router exists.
- Firewall: All incoming data packets are monitored and all incoming server requests are filtered.

1.2 Package Contents

- One Wireless 11g Broadband Router
- One 9V AC Power Adapter
- One CD including user's manual
- One RJ-45 Ethernet Cable

1.3 LEDs Indication & Connectors of Wireless Router

Front Panel LEDs Indication

LED	Light Status	Description
PWR	On	Wireless Router is powered on.
	Off	No power.
LAN (1, 2, 3, 4)	On	LAN port is successfully connected.
	Flashing	Data is being sent or received.
WAN	On	WAN port is successfully connected
	Flashing	Data is being sent or received.
ACT (WLAN)	Flashing	Data is being sent or received.
LINK (WLAN)	On	Wireless connection is ready.

Back Panel Connectors

Button/port	Description
Reset	Reset configurations to default. Press the button and hold for 10 seconds.
LAN (1x, 2x, 3x, 4x)	Connect LAN systems with RJ-45 cable.
WAN	Connect DSL or Cable modem.
DC IN	Connect with AC Power Adapter.

1.4 System Requirements

- One or more PCs (desktop or notebook) with Ethernet interface.
- TCP/IP protocol must be installed on all PCs.
- Have valid Internet Access account and a DSL or cable modem.
- 10/100BaseT network cables with RJ-45 connectors.
- In case to use Wireless Access Point, all Wireless devices must be compliant with IEEE 802.11b/g.
- System with MS Internet Explorer ver. 5.0 or later, or Netscape Navigator ver. 4.7 or later.

1.5 Installation Instruction

- 1) Power off Wireless Router and DSL/cable modem.
- 2) Connect systems to the LAN ports on the Wireless Router with straight LAN cables.
- 3) Connect the DSL or cable modem to the WAN port on the Wireless Router.
- 4) Power on DSL or cable modem first, then connect power adapter to the power jack on the Wireless Router and plug the power cable into an outlet.
- 5) Check LEDs.
 - a) Once power on Wireless Router, Power LED should be on.
 - b) LAN LED should be on for each active LAN connection.
 - c) The WAN LED should be on when the DSL or cable modem is connected.

Warning: Only use the power adapter is provided from this package, use other power adapter may cause hardware damage

2 PC Configuration

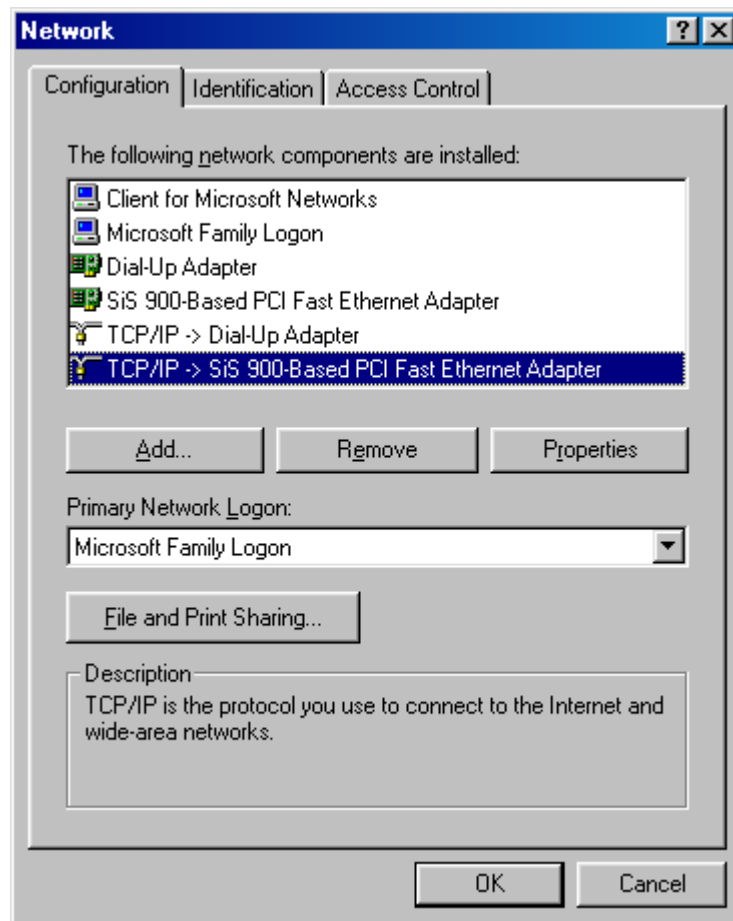

User needs to configure TCP/IP network settings, Internet access configuration and Wireless configuration for each system within Wireless Router's LAN network.

By default, Wireless Router acts as a DHCP server for server version of Windows, it automatically assigns IP address to each system when systems boot up. For all non-server version of Windows, the default TCP/IP setting acts as a DHCP client. If user chooses fixed IP addresses for client systems, the **Gateway** of the client system must be set to the IP address of the Wireless Router and **DNS** of the client system should be set to the address provided by your ISP.

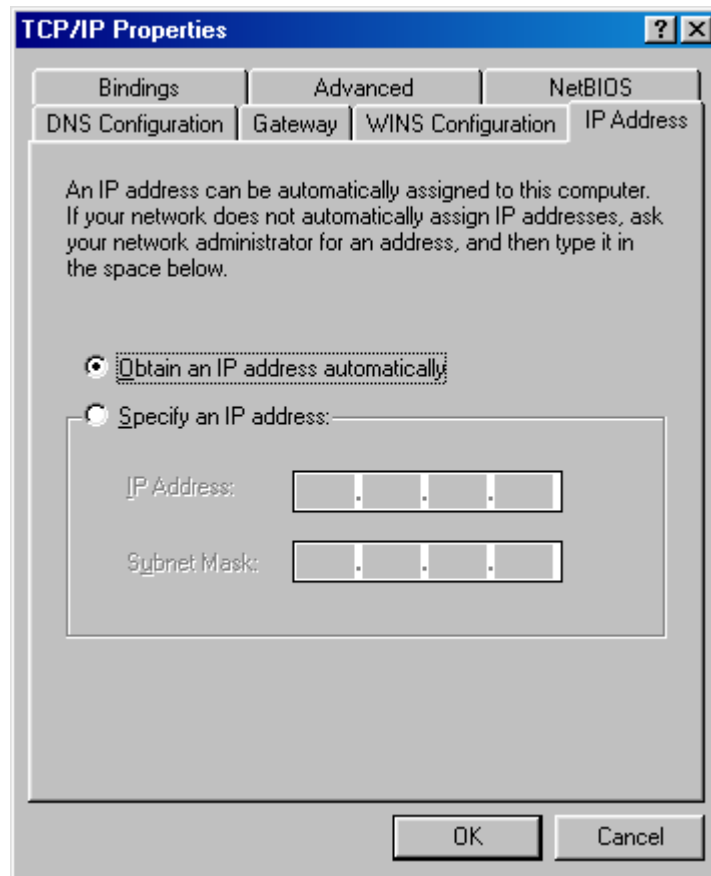

2.1 TCP/IP Networking Setup

Checking TCP/IP Settings for Windows 9x/Me

a) Select "**Start → Control Panel → Network**", the window below will appear:

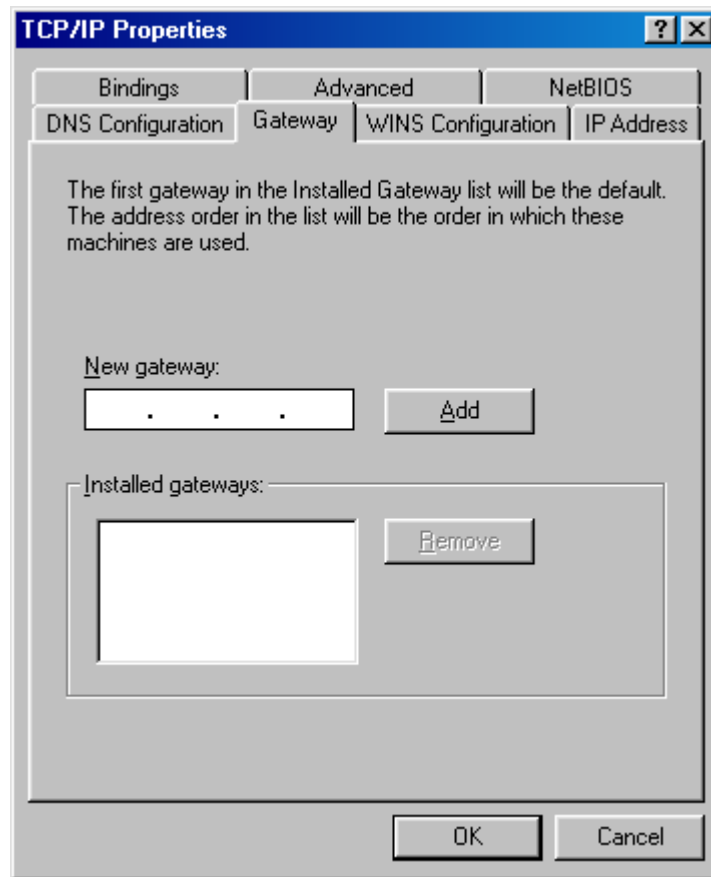

b) Click “**Properties**”, the window below will appear:

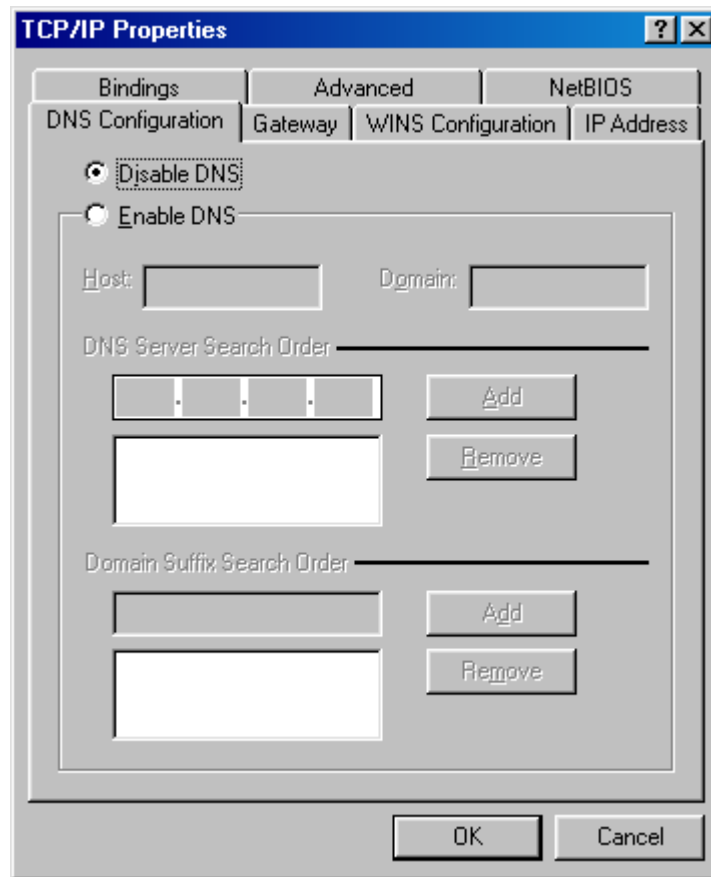

- If you decide to use DHCP, select “**Obtain an IP address automatically**”, then click “**OK**” to confirm your settings. Once you restart your system, Wireless Router will obtain an IP address for this system.
- If you decide to use fixed IP address for your system, select “**Specify an IP address**”, and make sure that **IP Address** and **Subnet Mask** are correct.

c) Select “**Gateway**” tab and enter correct gateway address in “**New gateway**” field, then click “**Add**”:

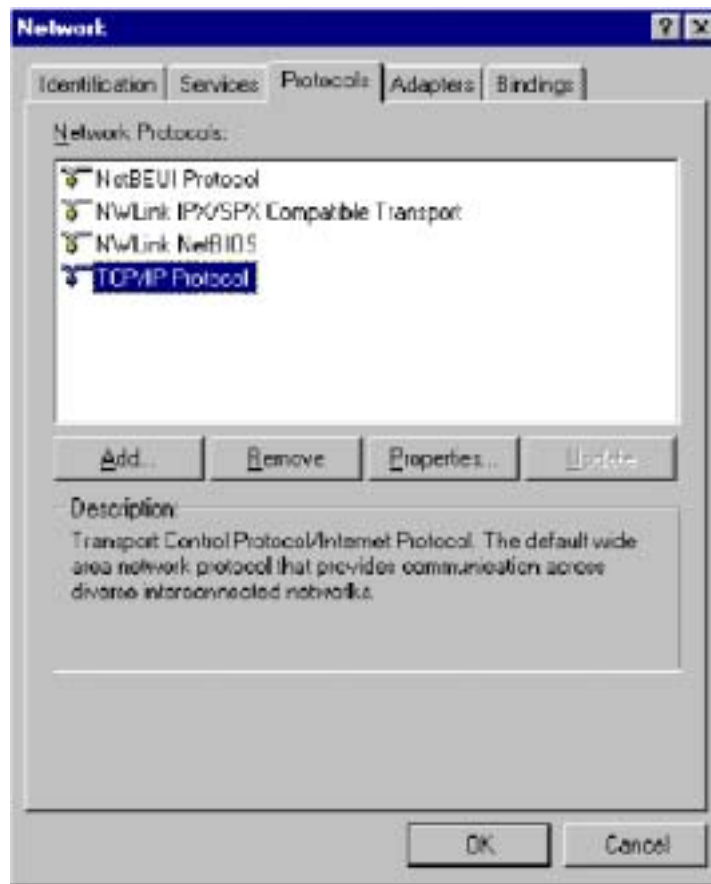

- d) Select **“DNS Configuration”** tab and make sure select **“Enable DNS”**, enter the DNS address provides from your ISP in the **“DNS Server Search Order”** field, then click **“Add”**:

Checking TC/IP Setting for Windows NT4.0

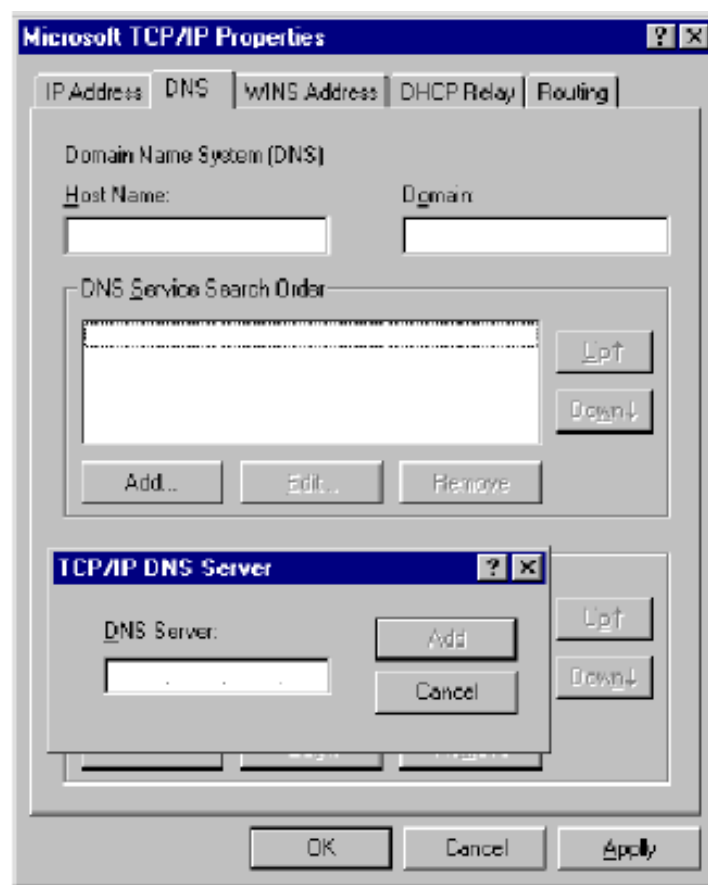

- a) Select "**Control Panel → Network**", click "**Protocols**" tab then select "**TCP/IP protocol**", window shown as below will appear:

- b) Click **“Properties”**, window shown as below will appear.

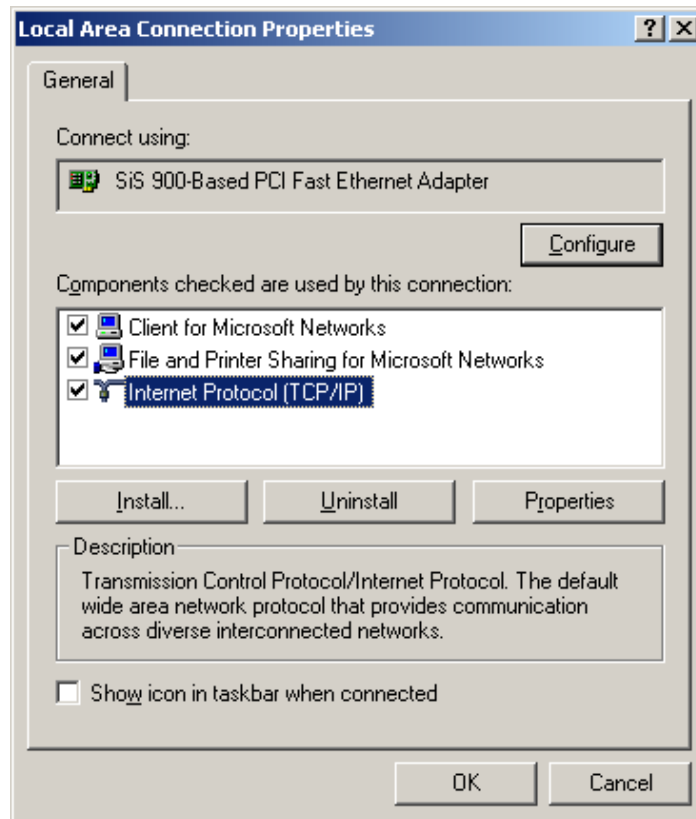

- Select the network card on your system from “**Adapter**” field.
 - If you decide to use IP address from Wireless Router, select “**Obtain an IP address from a DHCP server**”.
 - If you decide to use the IP address you are desired, select “**Specify an IP address**”. Make sure enter correct addresses in “**IP Address**” and “**Subnet Mask**” fields.
 - You must set Wireless Router’s IP address as “**Default Gateway**”.
- c) To enter DNS address is provided from your ISP. Select “**DNS**” tab, click “**Add**” under “**DNS Service Search Order**” list, then enter DNS Server IP address in “**TCP/IP DNS Server**” window and click “**Add**”.

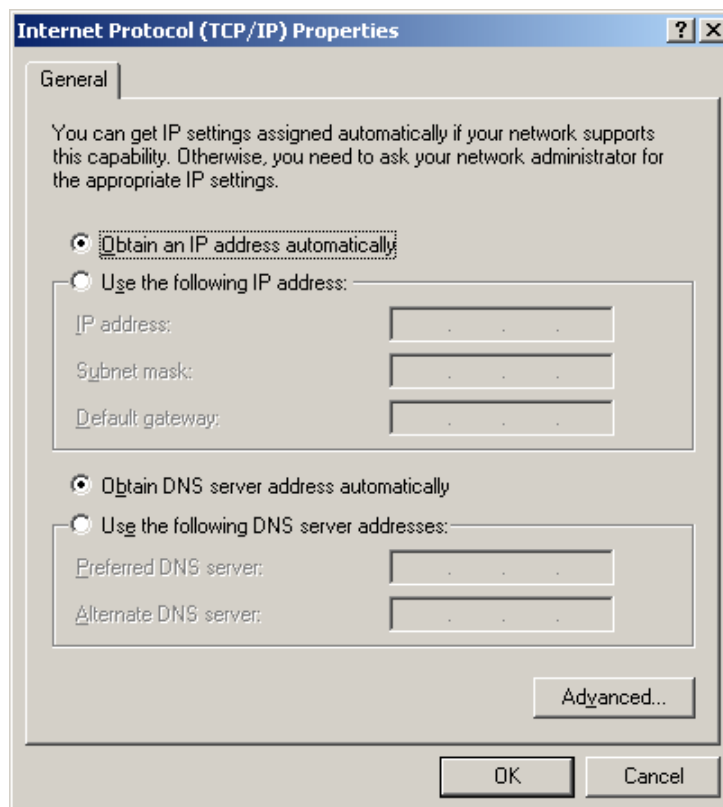

Checking TCP/IP Settings for Windows 2000

- a) Select “**Start → Control Panel → Network and Dial-up Connection**” and right click “**Local Area Connection**” then click “**Properties**”:

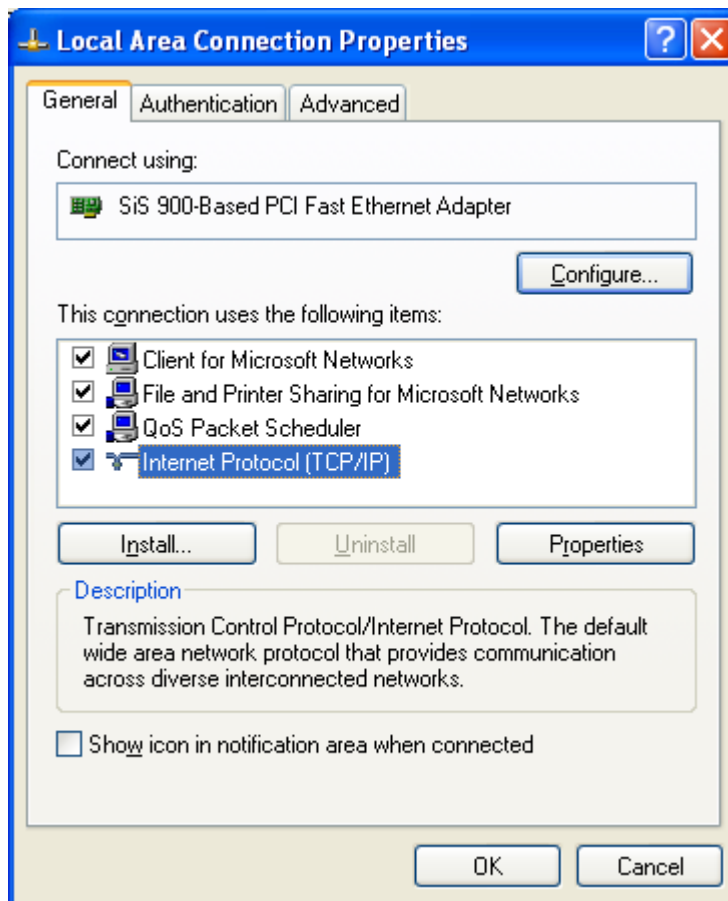

- b) Select the **“Internet Protocol (TCP/IP)”** for the network card on your system, then click **“Properties”**, window shown as below will appear.

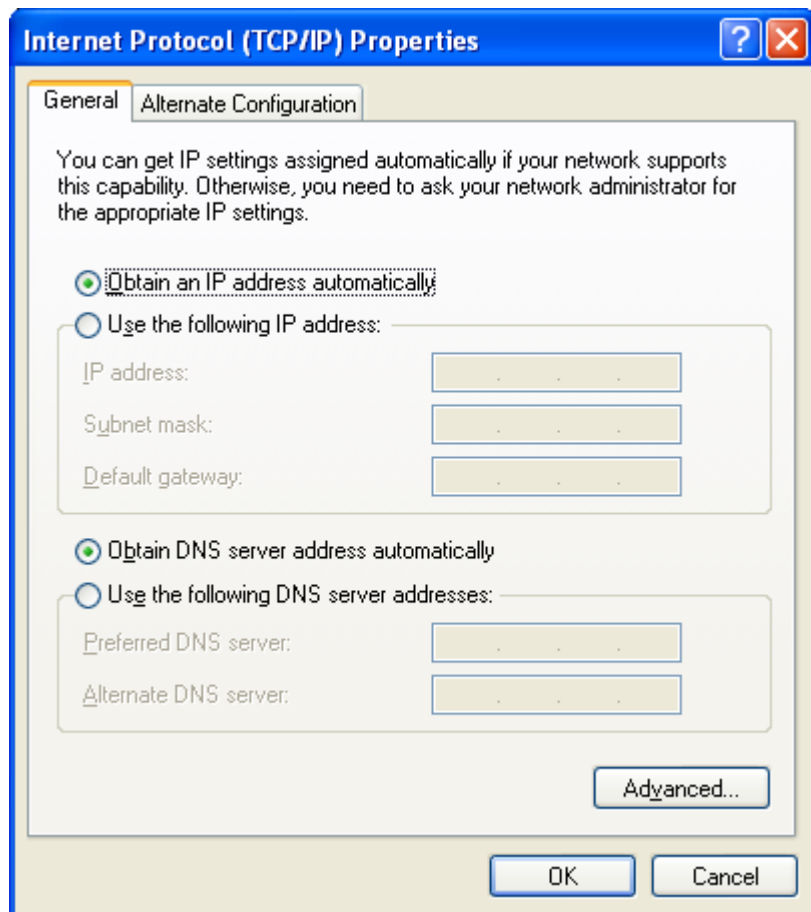

- If you decide to use IP address from Wireless Router, select **“Obtain an IP address automatically”**.
- If you decide to use the IP address you are desired, select **“Use the following IP address”**. Make sure enter correct addresses in **“IP Address”** and **“Subnet Mask”** fields.
- You must set Wireless Router’s IP address as **“Default Gateway”**.
- If the DNS Server fields are empty, select **“Use the following DNS server addresses”** and enter the DNS address is provided by your ISP, then click **“OK”**.

Checking TCP/IP Settings for Windows XP

- a) Click **“Start”**, select **“Control Panel → Network Connection”** and right click **“Local Area Connection”** then select **“Properties”**. The window shown as below will appear.

- b) Select **“Internet Protocol (TCP/IP)”** then click **“Properties”**, window shown as below will appear.

- If you decide to use IP address from Wireless Router, select **“Obtain an IP address automatically”**.
- If you decide to use the IP address you are desired, select **“Use the following IP address”**. Make sure enter correct addresses in **“IP Address”** and **“Subnet Mask”** fields.
- You must set Wireless Router’s IP address as **“Default Gateway”**.
- If the DNS Server fields are empty, select **“Use the following DNS server addresses”** and enter the DNS address is provided by your ISP, then click **“OK”**.

2.2 Setting up Internet Access

This section describes how to setup Wireless Router Internet access through DSL or cable modem.

For Windows 9x/2000

- a) Click "**Start**" and select "**Settings → Control Panel → Internet Options**".
- b) Select "**Connection**" tab then click "**Setup**" button.
- c) Select "**I want to set up my Internet connection manually, or I want to connect through a local area network (LAN)**" then click "**Next**".
- d) Select "**I connect through a local area network (LAN)**" then click "**Next**". Make sure all the boxes on the following LAN Internet Configuration screen are unchecked.
- e) Select "**No**" when "**Do you want to set up an Internet mail account now?**" prompts out.
- f) Click "**Finish**" to end setup process.

For Windows XP

- a) Click "**Start**" and select "**Control Panel → Network and Internet Connections**."
- b) Select "**Set up or Change your Internet Connection**."
- c) Click "**Connection**" tab, then click the "**Setup**" button. Click "**Cancel**" in the pop-up "**Location Information**" window.
- d) Click "**Next**" in the "**New Connection Wizard**" window.
- e) Select "**Connect to the Internet**" then click "**Next**".
- f) Select "**Set up my connection manually**" then click "**Next**".
- g) Select "**Connect using a broadband connection that is always on**" then click "**Next**".
- h) Click "**Finish**" to complete the setup process.

For Macintosh Clients

To access Internet via wireless router on Macintosh system, the set up procedures are showing below:

- a) Open the TCP/IP Control Panel.
- b) Select **Ethernet** from the Connect via pop-up menu.
- c) Select **Using DHCP Server** from the Configure pop-up menu. The **DHCP Client ID** field can be left blank.
- d) Close the TCP/IP panel and save your new settings.

If you decide to assign IP addresses manually instead of DHCP, set the **Router Address** field with wireless router's IP address and make sure DNS settings are correct.

For Linux Clients

To access Internet via the wireless router, you need to set the wireless router as the “Gateway”. Make sure login as “root” before attempting any changes.

Fixed IP Address

Most Linux installations use fixed IP address, if you wish to use a fixed IP address, make sure make the following changes.

- a) Set “Default Gateway” with the IP address of the wireless router.
- b) Make sure DNS settings are correct.

To act as a DHCP Client (recommended)

The procedures below may vary depending on version of Linux and X-windows shell.

- a) Start X-Windows.
- b) Select **Control Panel → Network**.
- c) Select the “Interface” entry for your Network card. Normally, this is called “eth0”.
- d) Click “Edit” button, set the “protocol” to “DHCP” and save.
- e) To apply all changes, use **Deactivate** and **Activate** buttons, if it is possible, restart your system.

2.3 Configure Wireless Station

This section describes how to configure all the wireless stations use Wireless Router as an Access Point. Each wireless station must have compatible settings as below.

Mode	All wireless stations must be set to “Infrastructure” mode.
SSID (ESSID)	This code must match the value uses for the Wireless Router. (Note: SSID code is case sensitive.)
WEP	By default, WEP encryption is set to 64-bits 10 hex digit.
WPA	By default, WPA-PSK Pass Phrase is set at PassPhrase, WPA G-Rekey Interval is set at 0 and WPA Data Encryption is at TKIP.

3. Setup Wireless Router Configurations via Web Browser

The Wireless Router comes with a web-based configuration utility. Users can access this configuration utility from any of client system within Wireless Router's LAN. For best results, either use Microsoft Internet Explorer 5.0 or later, or Netscape Navigator 4.7 or later.

Before you start configuring your Wireless Router, you have to get following information from your ISP:

- a) Has your ISP assigned you a static IP address, or they will assign one to you dynamically? If you have received a static IP address, what is it?
- b) Does your ISP use PPPoE? If so, what is your PPPoE username and password?

If you are not sure of above questions, please contact your ISP.

3.1 Start your Web Browser

To use the Web-Based Utility, you have to launch your Internet Browser (MS IE 5.0 or later, Netscape Navigator 4.7 or later).

Step1: Enter Wireless Router default IP address <http://192.168.1.1> in the Address field then hit Enter key:

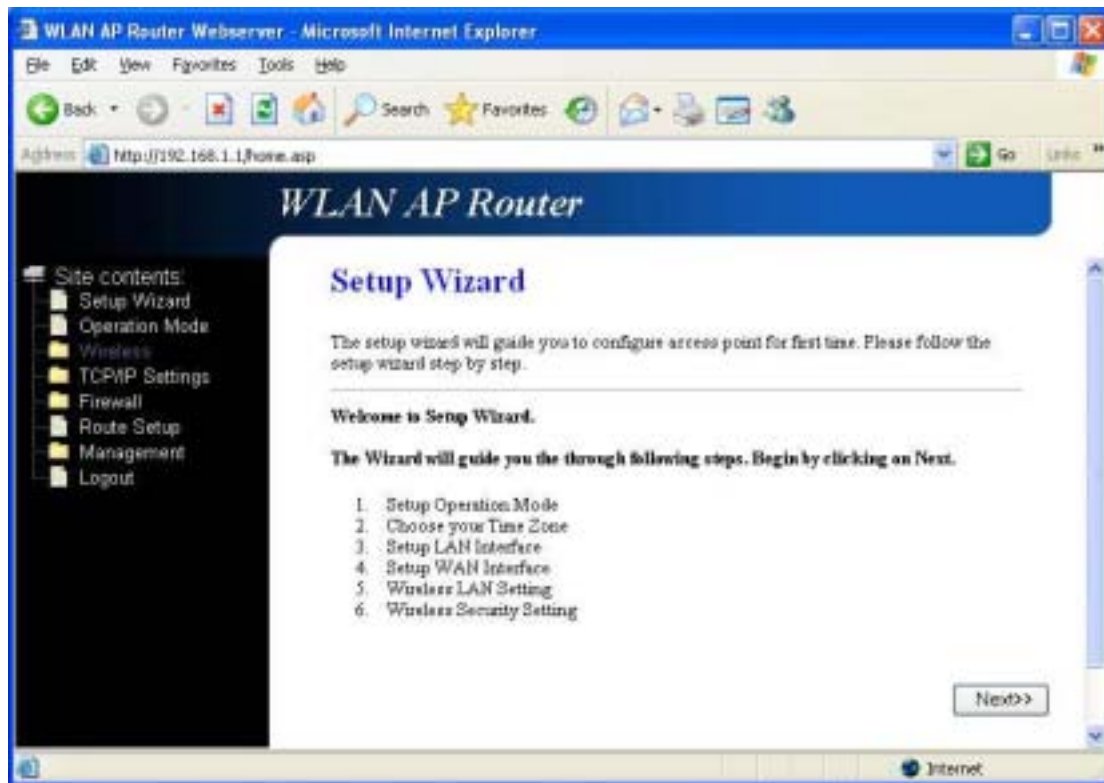

Step2: Login dialog box will appear, enter **admin** as User Name and default password is **1234**, then click "OK" to login web-based utility.

3.2 Setup Wizard

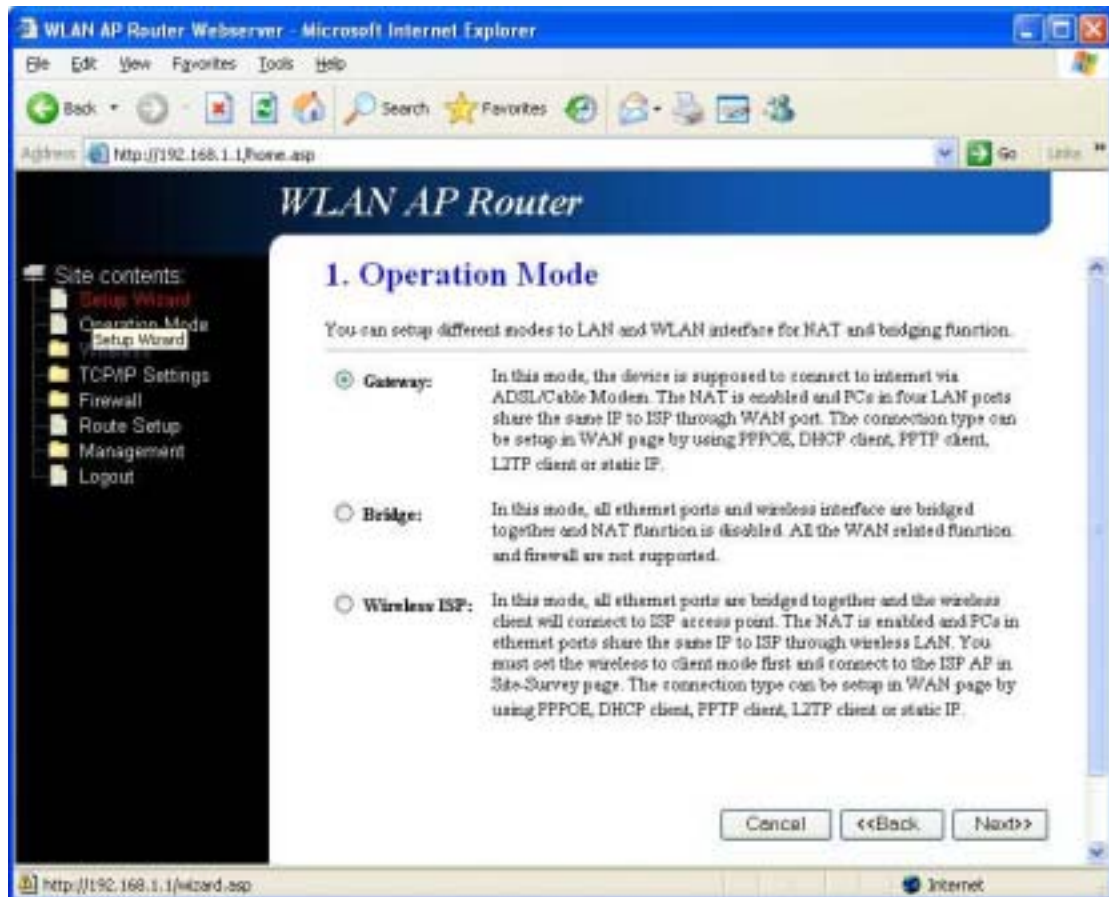

This Setup Wizard will guide you to configure access for the first time. Please follow the setup wizard step by step.

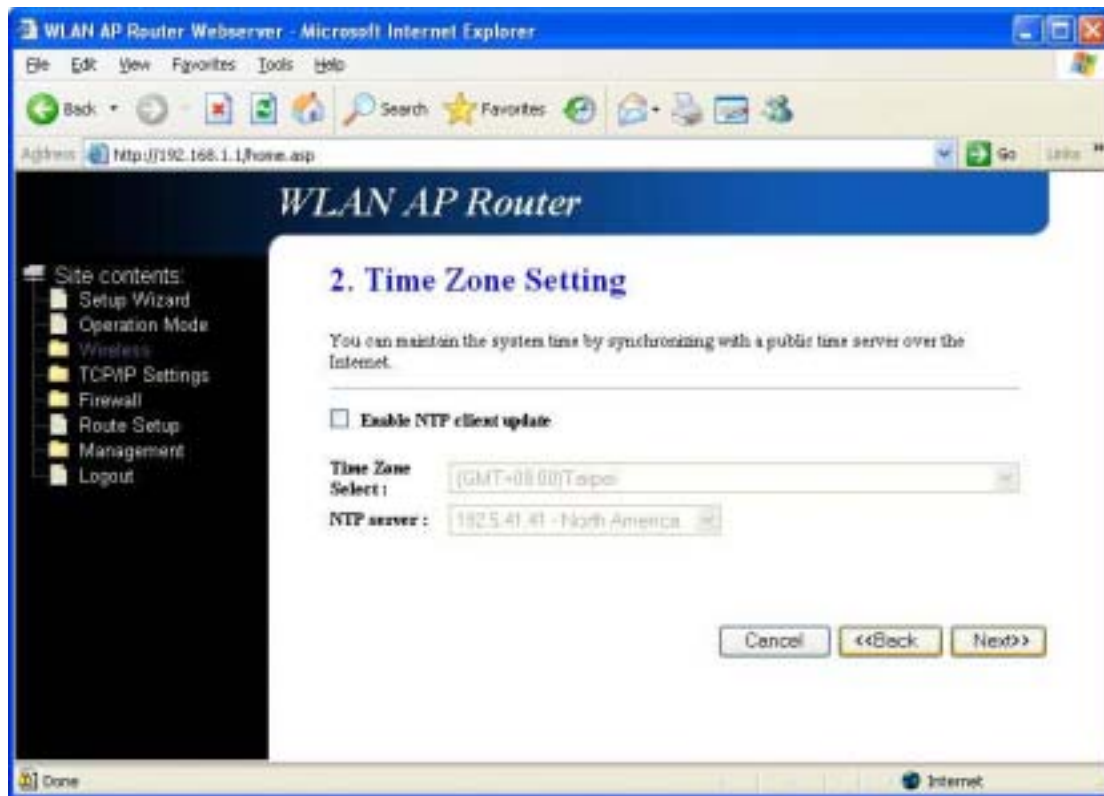

Depend on different modes, the setup wizard will be different. Please follow the below brief descriptions:

3.2.1 Gateway

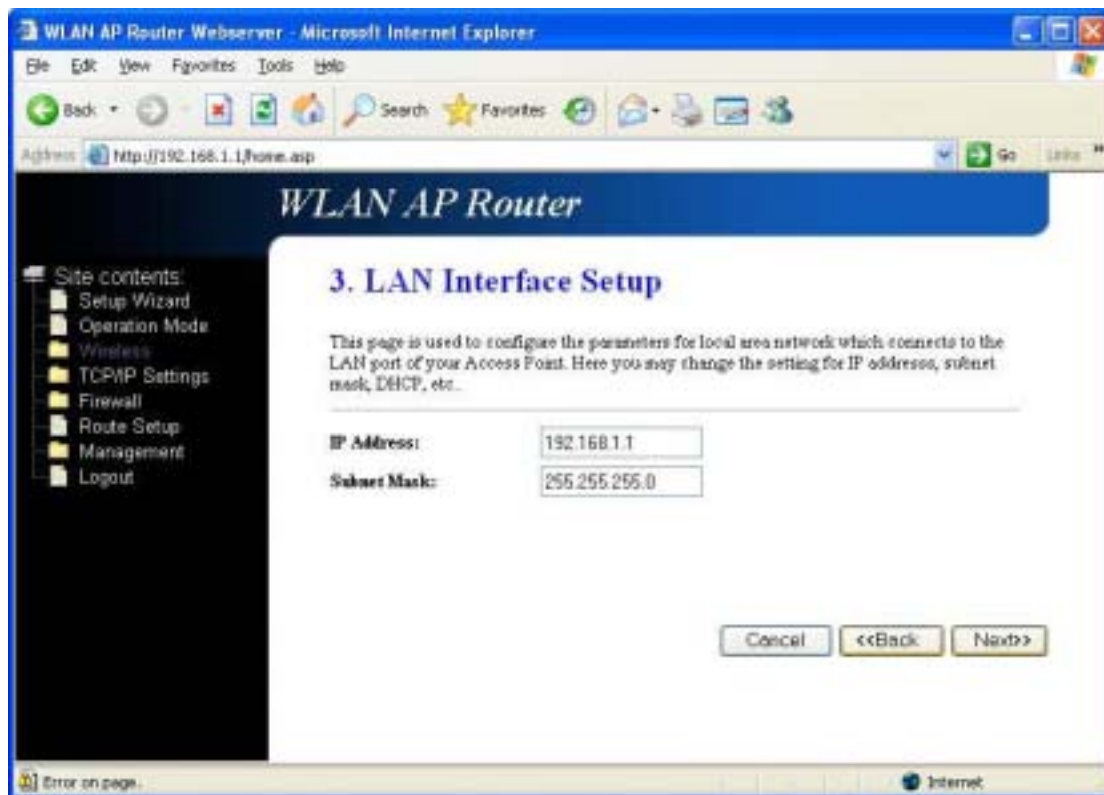

(1) Setup Operation Mode – Gateway: In this mode, the device is supposed to connect to internet via ADSL/Cable Modem. The NAT is enabled and PCs in four LAN ports share the same IP to ISP through WAN port. The connection type can be setup in WAN port. The connection type can be setup in WAN page by using PPPoE, DHCP client, PPTP client, L2TP client or static IP.

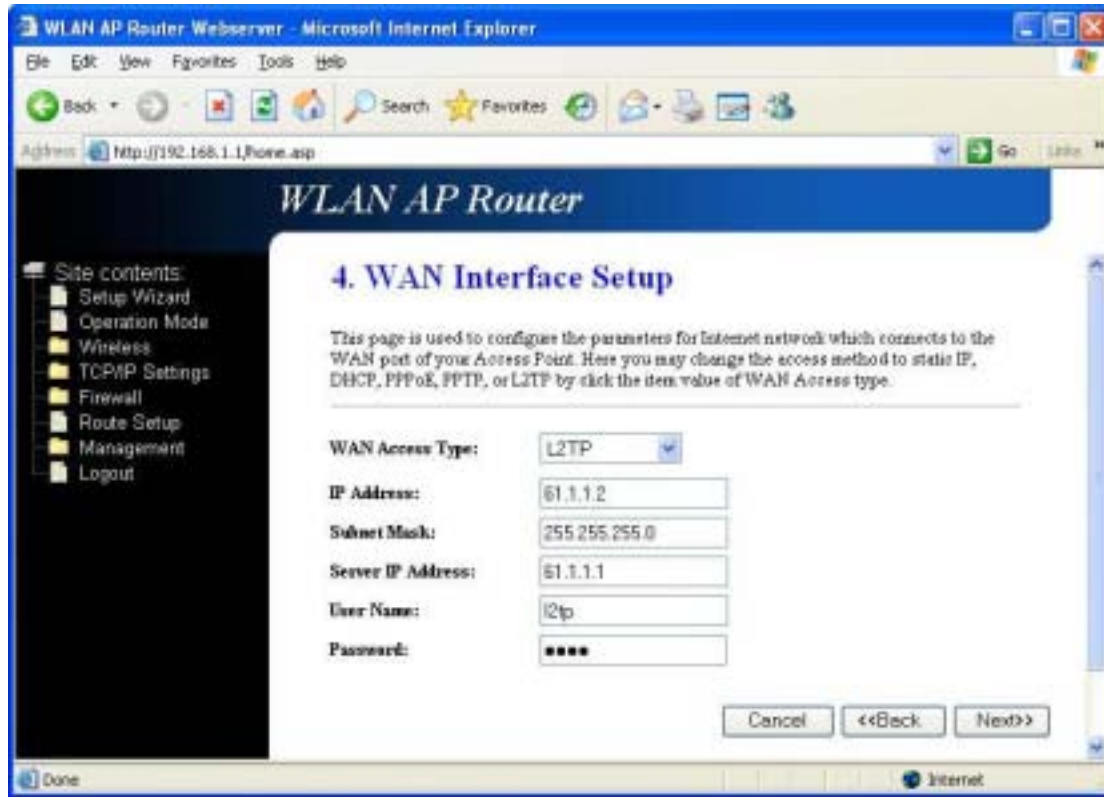

(2) Choose your Time Zone: You can maintain the system time by synchronizing with a public server over the Internet.

(3) Setup LAN Interface: This page is used to configure the parameters for local area network which connects to the LAN port of your Access Point. Here you may change the setting for IP address, subnet mask, DHCP, etc.

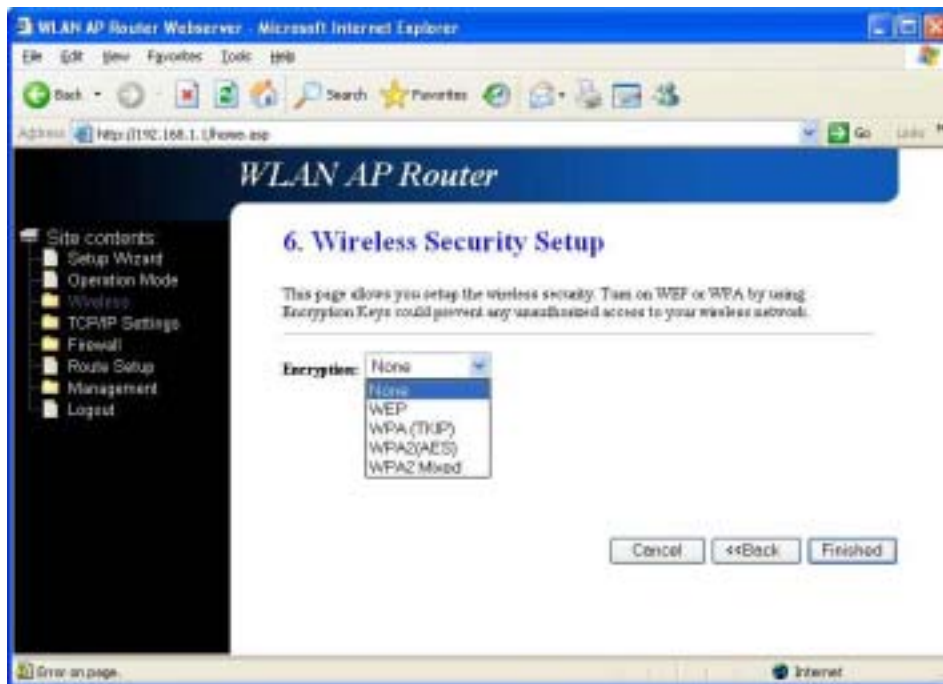

(4) Setup WAN Interface: This page is used to configure the parameters for Internet network which connects to the WAN port of your Access Point. Here you may change the access method to static IP, DHCP, PPPoE, PPTP, or L2TP by click the item value of WAN Access type.

(5) Wireless LAN Setting: This page is used to configure the parameters for wireless LAN clients who may connect to your Access Point.

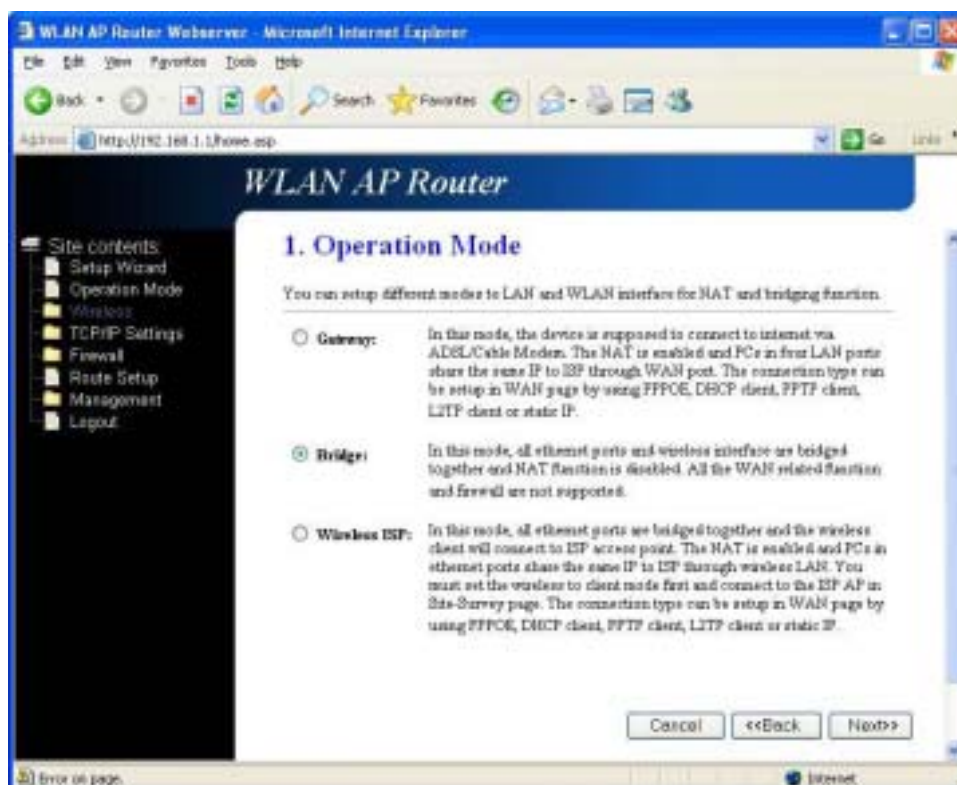

(6) Wireless Security: This page allows you setup the wireless security. Turn on WEP or WPA by using Encryption Keys could prevent any unauthorized access to your wireless network.

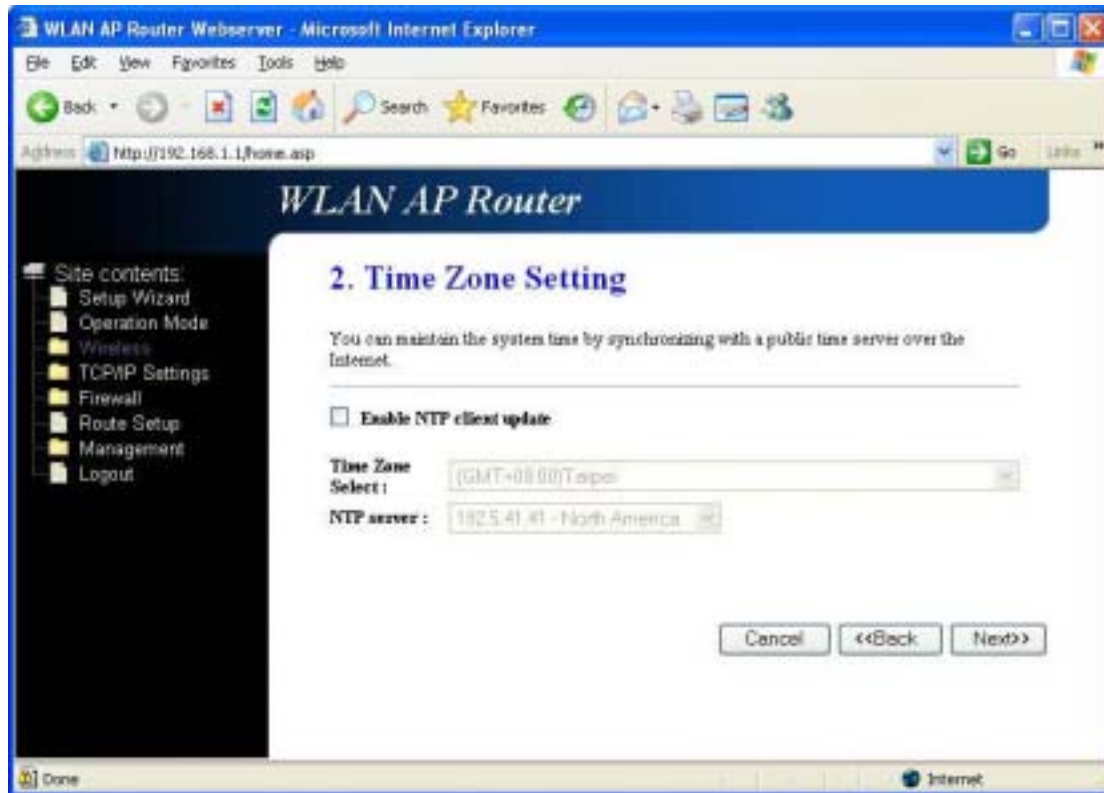

3.2.2 Bridge

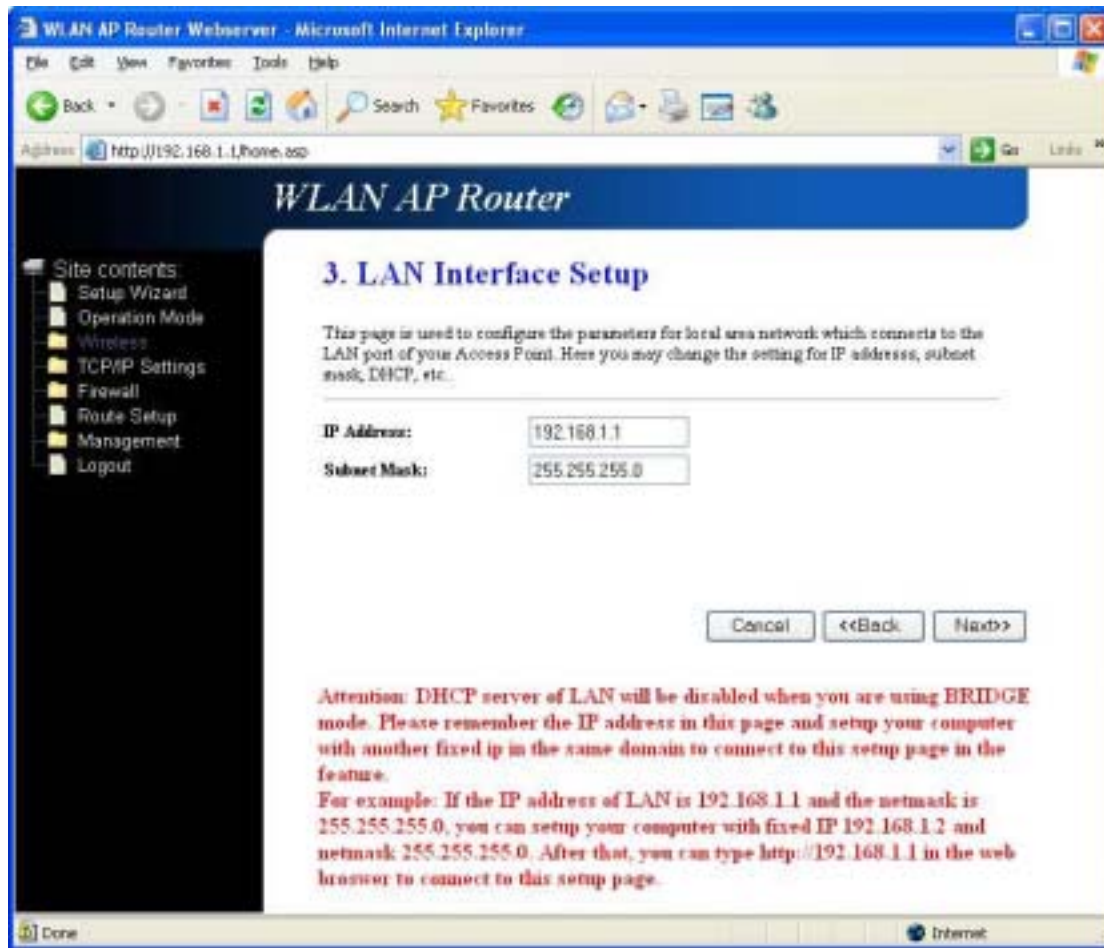

(1) Setup Operation Mode – Bridge: In this mode, all Ethernet ports and wireless interface are bridged together and NAT function is disabled. All the WAN related function and firewall are not supported.

(2) Choose your Time Zone: You can maintain the system time by synchronizing with a public server over the Internet.

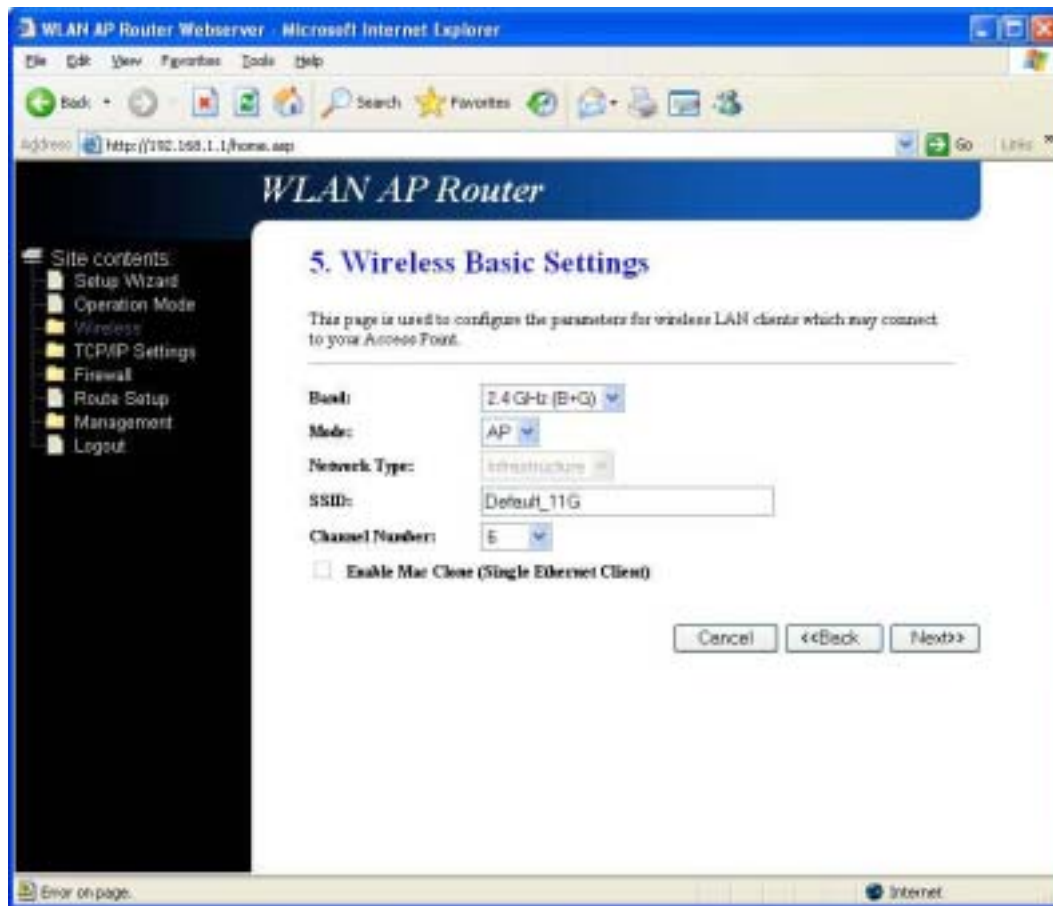

(3) Setup LAN Interface: This page is user to configure the parameters for local area network which connects to the LAN port of your Access Point. Here you may change the setting for IP address, subnet mask, DHCP, etc.

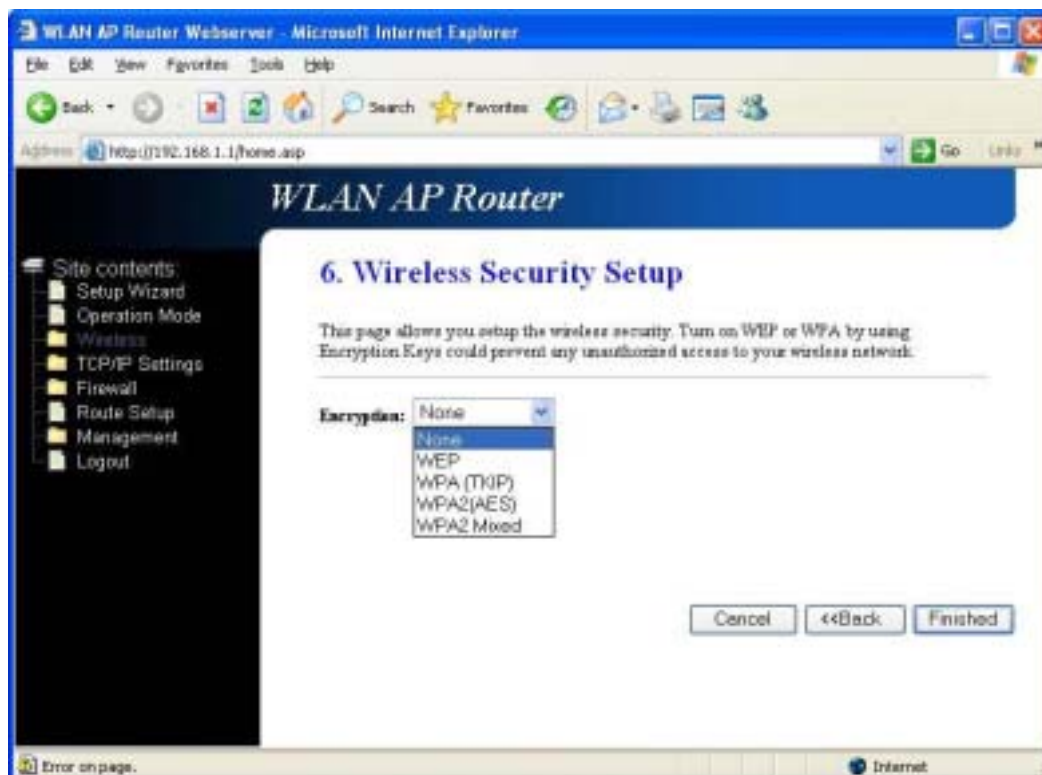

Attention: DHCP server of LAN will be disabled when you are using BRIDGE mode. Please remember the IP address in this page and set up your computer with another fix IP in the same domain to connect to this setup page in the future.

For Example: If the IP address of LAN is 192.168.1.1 and the Netmask is 255.255.255.0, you can setup your computer with fixed IP 192.168.1.2 and Netmask as 255.255.255.0. After that, you can type <http://192.168.1.1> in the web browser to connect this setup page.

(4) Wireless Basic Settings: This page is used to configure the parameters for wireless LAN clients who may connect to your Access Point.

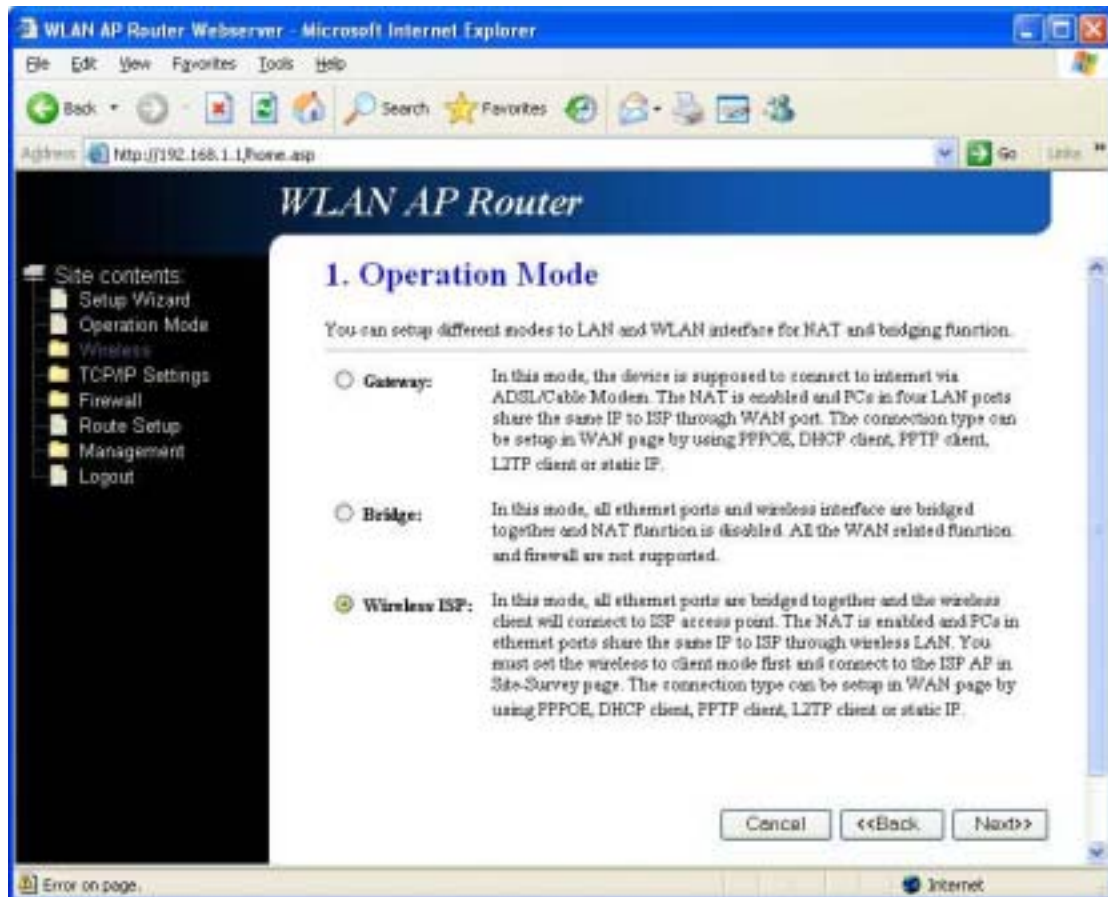

(6) **Wireless Security:** This page allows you setup the wireless security. Turn on WEP or WPA by using Encryption Keys could prevent any unauthorized access to your wireless network.

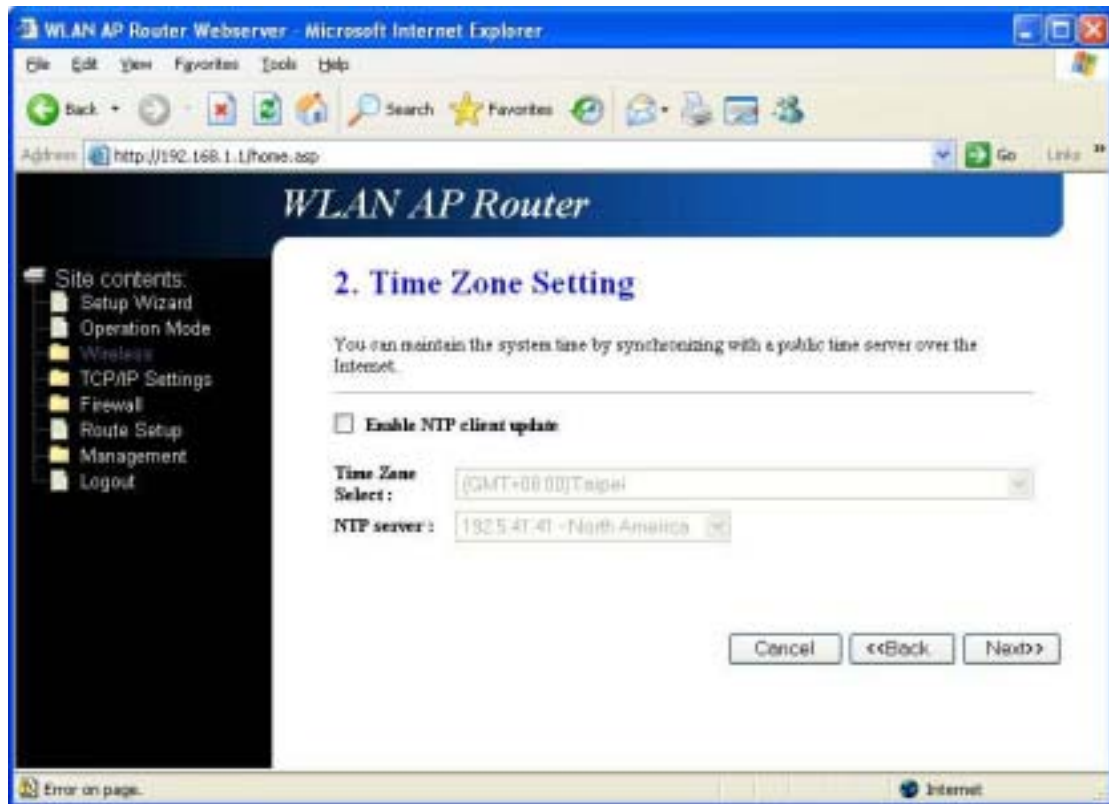

3.2.3 Wireless ISP

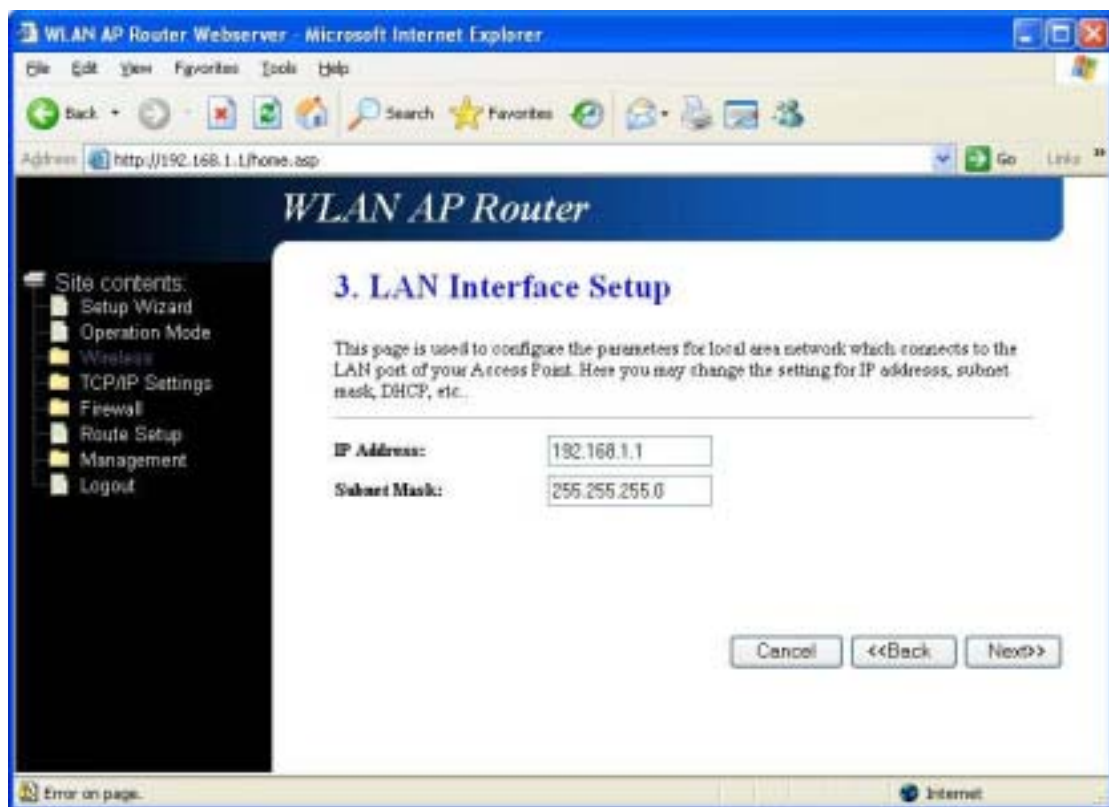

(1) Setup Operation Mode – Wireless IP: In this mode, all Ethernet ports are bridged together and the wireless client will connect to ISP access point. The NAT is enabled and PCs in Ethernet ports share the same IP to ISP through wireless LAN. You must set the wireless to client mode first and connect to the ISP AP in Site-Survey page. The connection type can be setup in Wan page by using PPPoE, DHCP client, PPTP client, L2TP client or static IP.

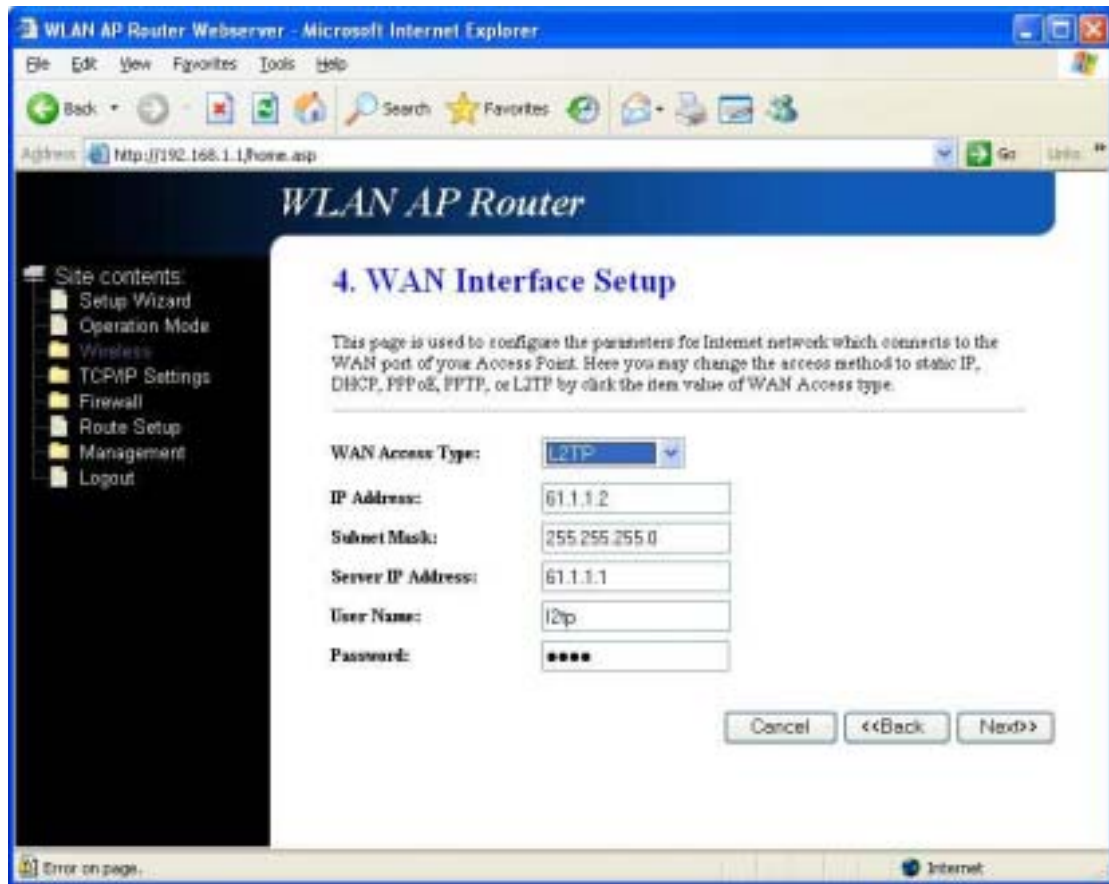

(2) Choose your Time Zone: You can maintain the system time by synchronizing with a public server over the Internet.

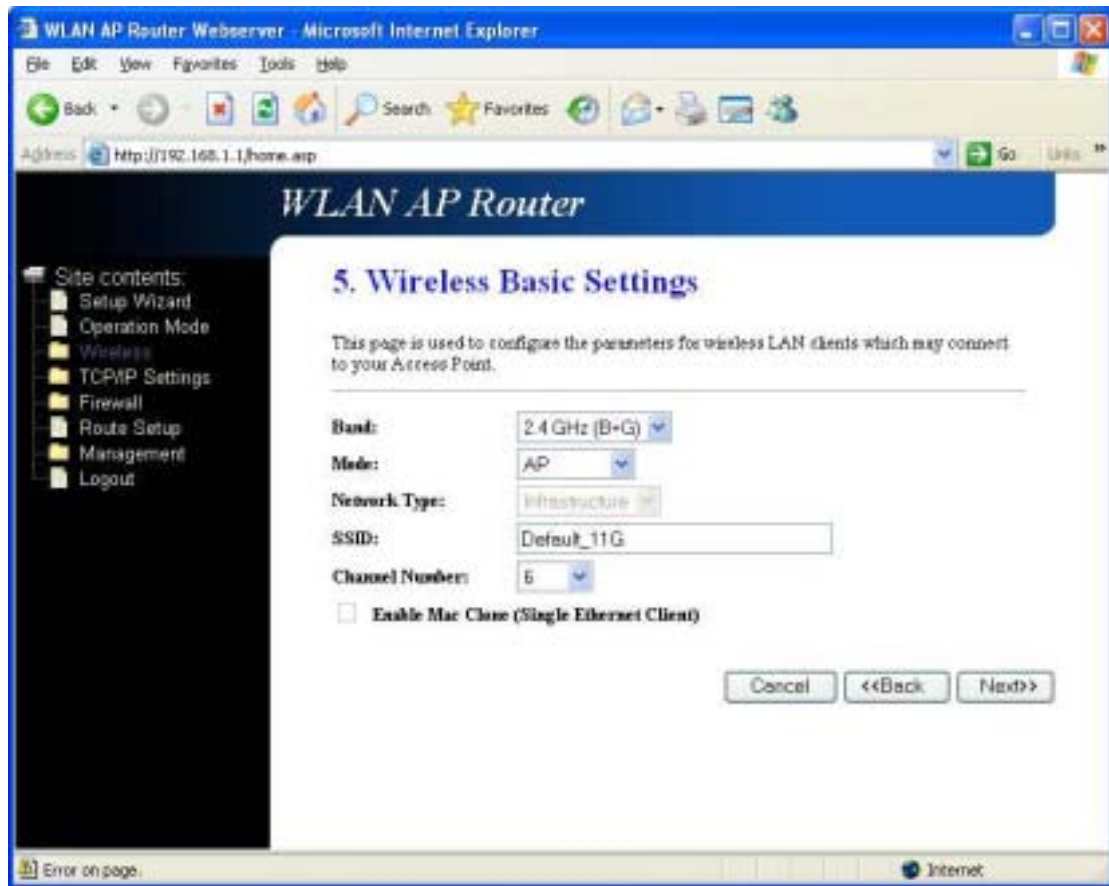

(3) **Setup LAN Interface:** This page is used to configure the parameters for local area network which connects to the LAN port of your Access Point. Here you may change the setting for IP address, subnet mask, DHCP, etc.

(4) Setup WAN Interface: This page is used to configure the parameters for Internet network which connects to the WAN port of your Access Point. Here you may change the access method to static IP, DHCP, PPPoE, PPTP, or L2TP by click the item value of WAN Access type.

(5) Wireless LAN Setting: This page is used to configure the parameters for wireless LAN clients who may connect to your Access Point.

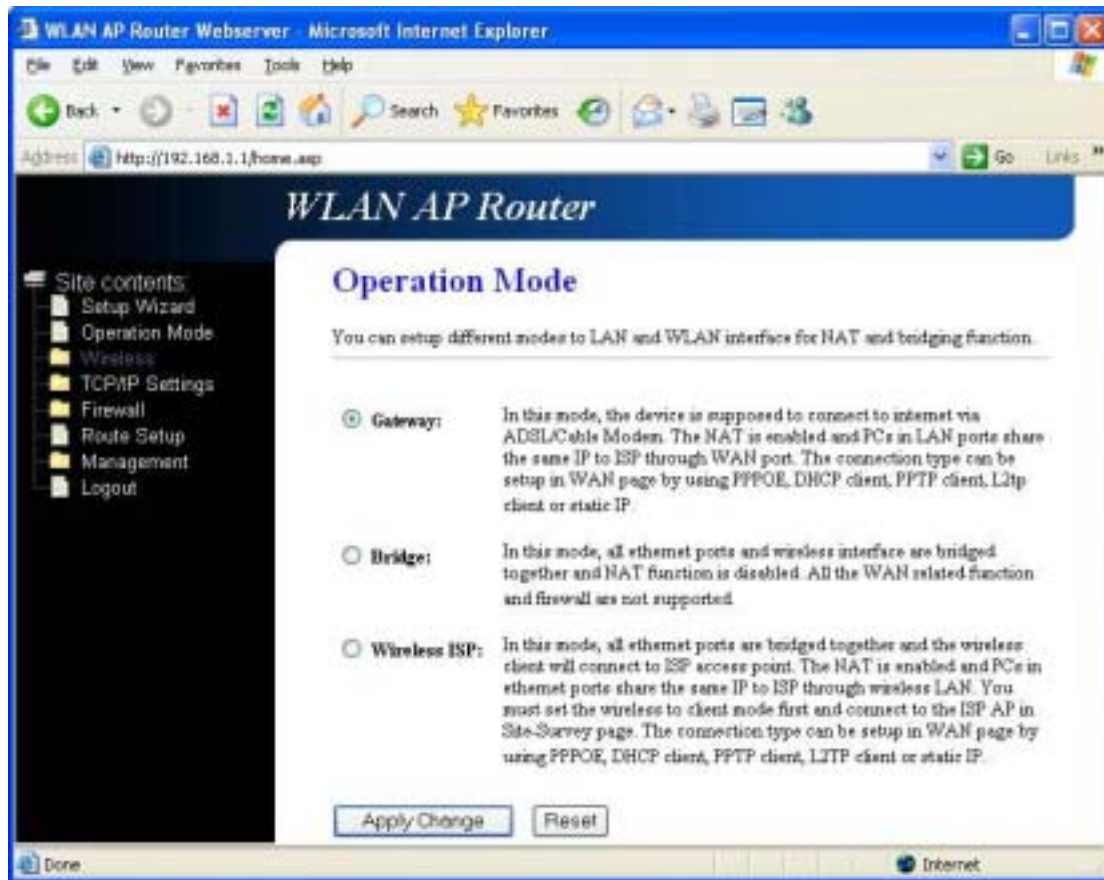

(6) **Wireless Security:** This page allows you setup the wireless security. Turn on WEP or WPA by using Encryption Keys could prevent any unauthorized access to your wireless network.

3.3 Operation Mode

You can setup different modes to LAN and WLAN interface for NAT and bridging function.

Gateway: In this mode, the device is supposed to connect to internet via ADSL/Cable Modem. The NAT is enabled and PCs in LAN ports share the same IP to ISP through WAN port. The connection type can be setup in WAN page by using PPPoE, DHCP client, PPTP client, L2TP client or static IP.

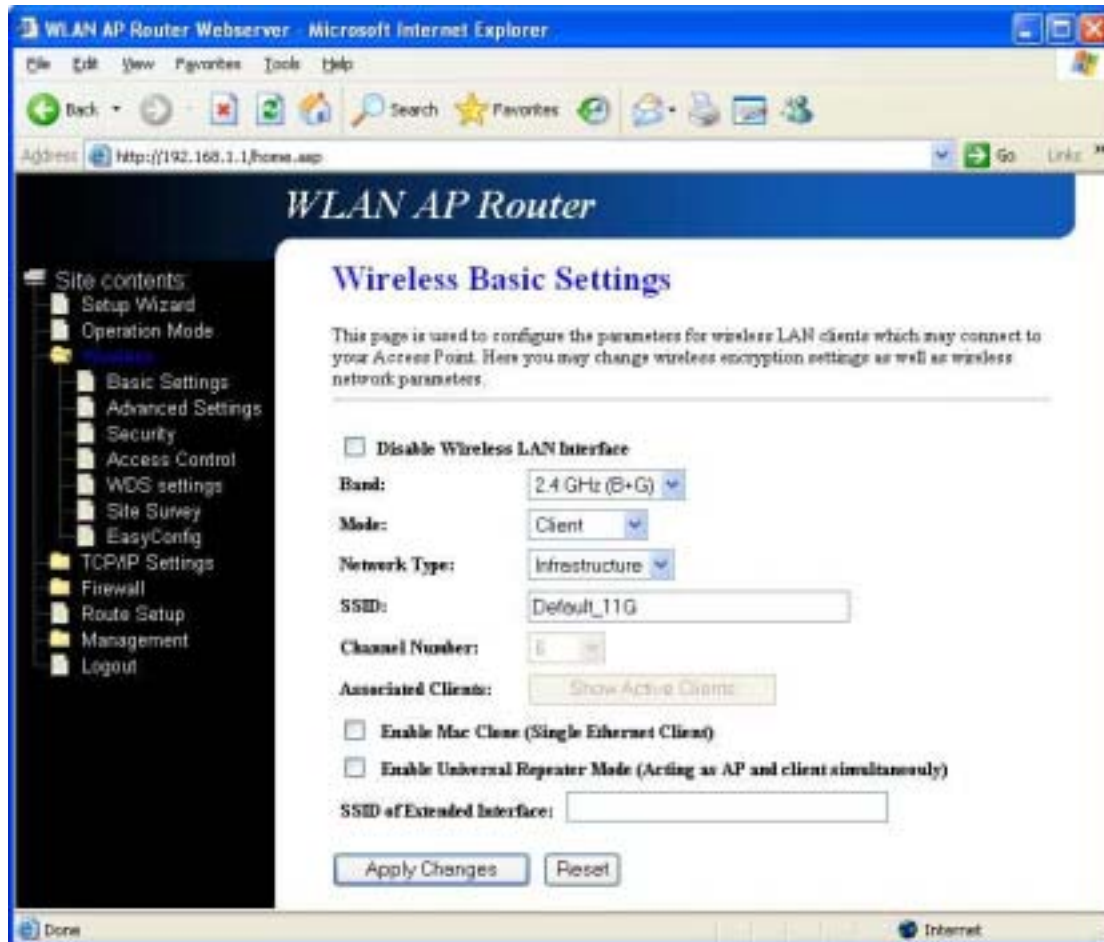

Bridged: In this mode, all Ethernet ports and wireless interface are bridged together and NAT function is disabled. All the WAN related function and firewall are not supported.

Wireless ISP: In this more, all Ethernet ports are bridged together and the wireless client will connect to ISP access point. The NAT is enabled and PCs in Ethernet ports share the same IP to ISP through wireless LAN. You must set the wireless to client mode first and connect to the ISP AP in Site-Survey page. The connection type can be setup in WAN page by using PPPoE, DHCP client, L2TP client or static IP.

3.4 Wireless

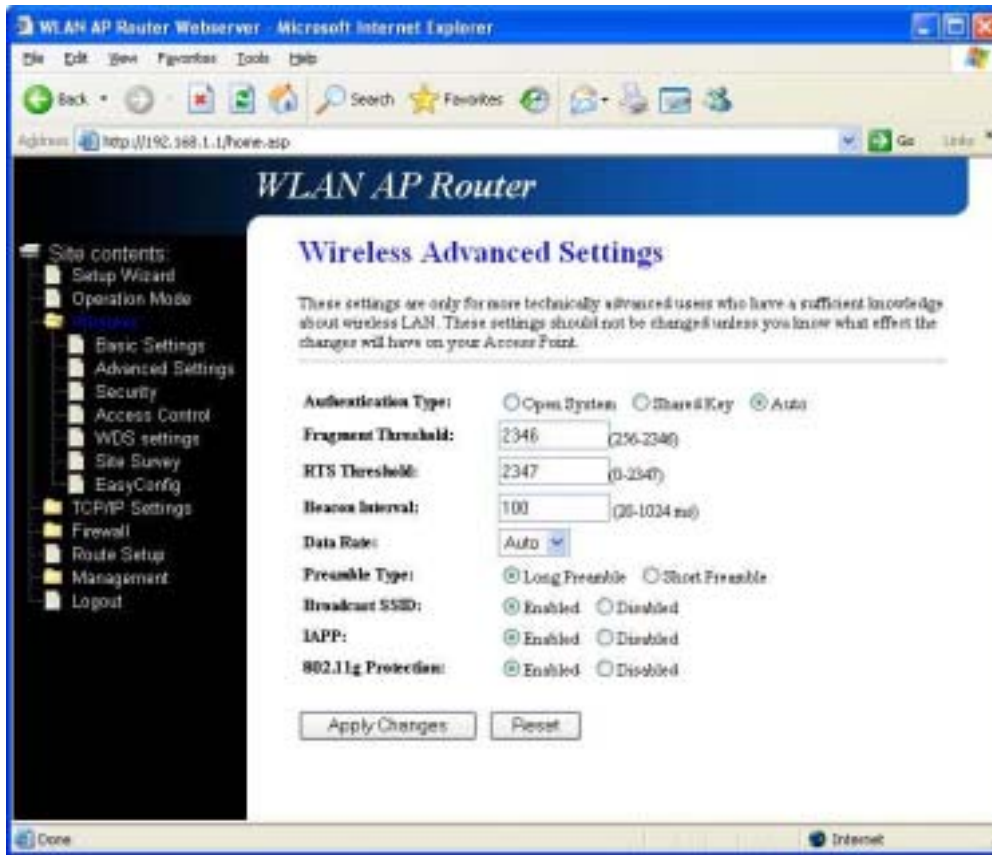

3.4.1 Basic Settings

This page is used to configure the parameters for wireless LAN clients who may connect to your Access Point. Here you may change wireless encryption settings as well as wireless network parameters.

3.4.2 Advanced Settings

These settings are only for more technically advanced users who have a sufficient knowledge about the wireless LAN. These settings should not be changed unless you know what effect the changes will have on your Access Point.

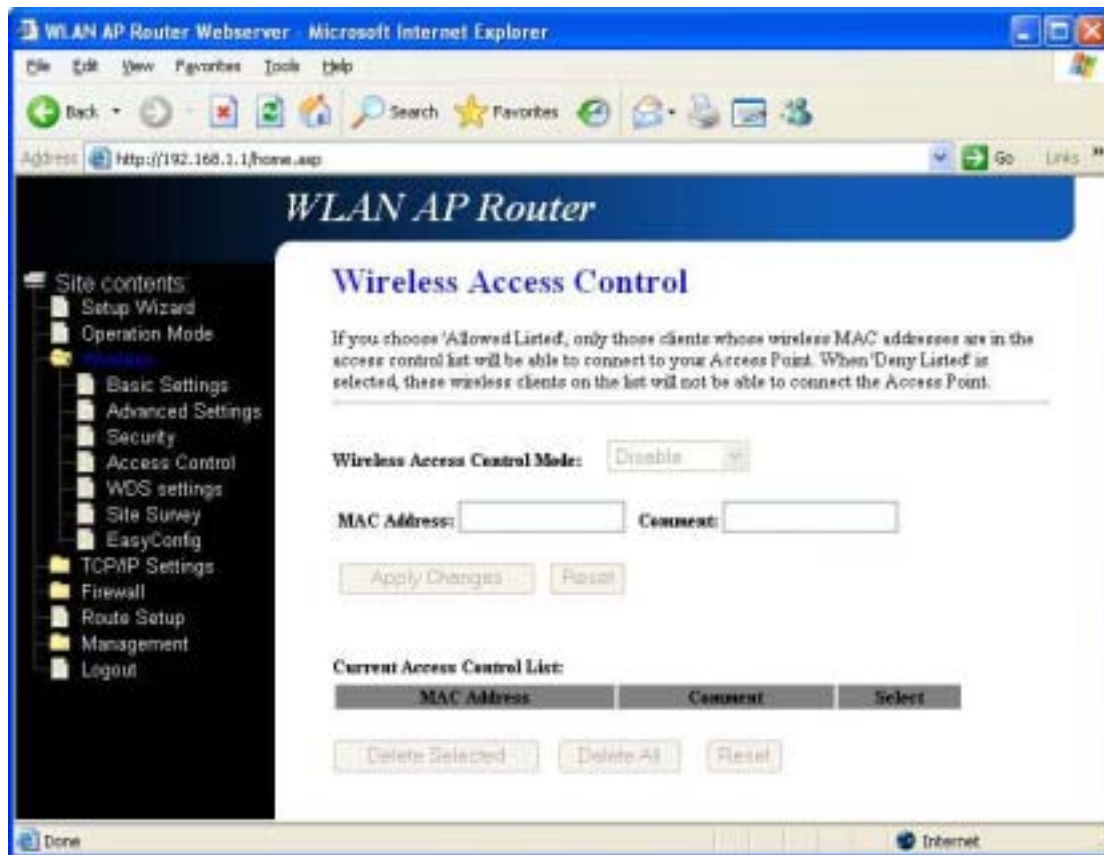

3.4.3 Security

This page allows you setup the wireless security. Turn on WEP or WPA by using Encryption Keys could prevent any unauthorized access to your wireless network.

The screenshot shows a web browser window titled "WLAN AP Router Webserver - Microsoft Internet Explorer". The address bar shows "http://192.168.1.1/home.asp". The page title is "WLAN AP Router". The main heading is "Wireless Security Setup". Below the heading, there is a descriptive text: "This page allows you setup the wireless security. Turn on WEP or WPA by using Encryption Keys could prevent any unauthorized access to your wireless network." The form includes several sections: "Encryption:" with a dropdown menu set to "None" and a "Set WEP Key" button; "Use 802.1x Authentication:" with an unchecked checkbox; "WPA Authentication Mode:" with radio buttons for "Enterprise (RADIUS)" and "Personal (Pre-Shared Key)"; "WPA Cipher Suite:" with radio buttons for "TKIP" and "AES"; "WPA2 Cipher Suite:" with radio buttons for "TKIP" and "AES"; "Pre-Shared Key Format:" with a dropdown menu set to "Passphrase"; "Pre-Shared Key:" with a text input field; "Enable Pre-Authentication:" with an unchecked checkbox; "Authentication RADIUS Server:" with fields for "Port" (set to 1812), "IP address", and "Password"; and a "Note:" stating "When encryption WEP is selected, you must set WEP key value." At the bottom, there are "Apply Changes" and "Reset" buttons. A sidebar on the left lists site contents including Setup Wizard, Operation Mode, Security, Access Control, WDS settings, Site Survey, EasyConfig, TCP/IP Settings, Firewall, Route Setup, Management, and Logout.

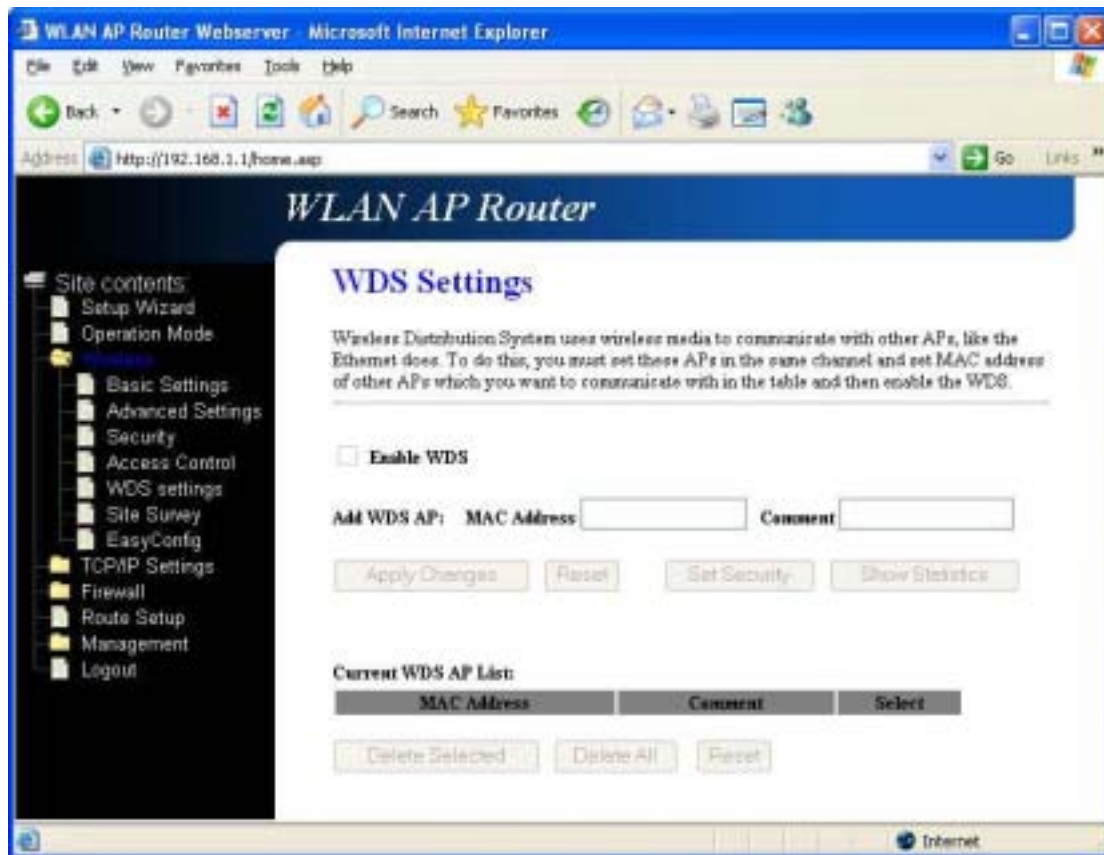

3.4.4 Access Control

If you choose “Allowed Listed”, only those clients whose wireless MAC addresses are in the access control list will be able to connect to your Access Point. When “Deny Listed” is selected, these wireless clients on the list will not be able to connect the Access Point.

3.4.5 WDS Settings

Wireless Distribution System uses wireless media to communicate with other APs, like the Ethernet does. To do this, you must set these APs in the same channel and set MAC address of other APs which you want to communicate with in the table and enable the WDS.

3.4.6 Site Survey

This page provides tool to scan the wireless network. If any Access Point or IBSS is found, you could choose to connect it manually when client mode is enabled.

The screenshot shows the 'WLAN AP Router' web interface in Microsoft Internet Explorer. The address bar shows 'http://192.168.1.1/home.asp'. The page title is 'WLAN AP Router'. The main content area is titled 'Wireless Site Survey' and contains the following text: 'This page provides tool to scan the wireless network. If any Access Point or IBSS is found, you could choose to connect it manually when client mode is enabled.'

SSID	BSSID	Channel	Type	Encrypt	Signal	Select
WRJ14WM_TEST1	00:14:85:e3:d7:69	11 (B+G)	AP	no	92	<input type="radio"/>
11G_SW	00:06:4f:12:40:01	6 (B+G)	AP	WEP	72	<input type="radio"/>
PRONETS	00:06:4f:0a:e7:e6	1 (B+G)	AP	no	40	<input type="radio"/>
Generic	00:e0:4f:da:8d:42	1 (B+G)	AP	no	32	<input type="radio"/>

Below the table are two buttons: 'Refresh' and 'Connect'.

3.4.7 Easy Config

This page allows you to change the setting for EasyConfig. Use this feature could let your wireless client automatically synchronize its setting and connect to the Access Point in a minute with any hassle.

Below describes what Realtek EasyConfig is and how to use it in Realtek wlan Access Point and PCI/mini-PCI/Card bus/USB client adapter.

By using EasyConfig, AP and client will auto-negotiate the setting for SSID and WPA/WPA2 PSK (Pre-Shared Key), and then the client will associate to AP automatically with WPA/WPA2 security enabled. After AP has been successfully configured with an EasyConfig client, AP will use and deliver the same setting to any client requesting for EasyConfig hereafter. Thus, it will make every EasyConfig client could communicate to AP by sharing the same SSID and PSK.

Currently WLAN AP could support wlan security for WPA-TKIP and WPA2-AES (The supported capability could be configurable in AP config file, the config detail will be described in the following section). When do EasyConfig, the client will propose its request algorithm (WPA-TKIP or WPA2-AES), and AP will choose which encryption algorithm will be adopted by checking the client request and its own capability. If AP is configured to support WPA-TKIP and WPA2-AES, it will accept any EasyConfig client request for WPA-TKIP or WPA2-AES, and both WPA-TKIP and WPA2-AES encryption algorithms could be used concurrently in AP.

Realtek EasyConfig has implemented two methods as:

Button Mode: User only needs push a touch-button in AP and client utility (a button in client Utility program), then it will do EasyConfig automatically between AP and client.

Q&A Mode: User needs answer some questions in client side, and selects the same questions and gives same answers for the new joined client configuration.

The following sections show you how to use it in AP and client respectively in more detail.

AP Operation

In Realtek AP web server, you could find an EasyConfig web page shown as the figure below:

Figure 1

To use EasyConfig, you must enable the checkbox of **“Enable EasyConfig”** first. Then, you could select which method (button, Q&A or both button and Q&A) AP could support by clicking the **“Configure Method”** pull-down list.

If **“Button”** mode is selected, user could push EasyConfig button on the WLAN evaluation board for 4-5 seconds. Then, EasyConfig LED will begin to blink (on/off in 1 second interval) to wait for client EasyConfig Button mode request. Please note, the LED will continue blinking until any one client has been successfully accomplished EasyConfig negotiation.

Beside the push button on evaluation board, user may click **“Waiting Button Mode Request”** button in web page (as shown in above figure) to let AP enter the waiting state.

If any one client has done the EasyConfig successfully, the PSK will be generated and you may see the encryption key displayed on the EasyConfig page (as shown in Figure-1). When EasyConfig SSID and PSK are adopted, the EasyConfig LED will be steady on. Please note, when EasyConfig setting has been generated, you may not be able to change AP setting for SSID and wireless security any more, unless EasyConfig is disabled.

If “**Q&A**” mode is selected, AP is ready to accept the EasyConfig client request for Q&A mode. The client side operation will be explained in following sections. If any one client has done the EasyConfig in Q&A mode with AP, the EasyConfig web page will show “**yes**” on “**Q&A Installed**” item as shown in Figure-1 to indicate the AP has been configured by Q&A mode. It implies that any client should select the same question and give the same answer as first client used when they do the EasyConfig in Q&A mode.

User may click “**Delete Key**” button to delete all installed encryption key, SSID and Q&A value.

Windows Utility Operation (for 8185/8187 Adapter)

Launch Realtek wireless client utility on Windows platform (2K or XP), you will see there is an Easy Config tab existed, click the tab you will see a interface as shown in following figure:

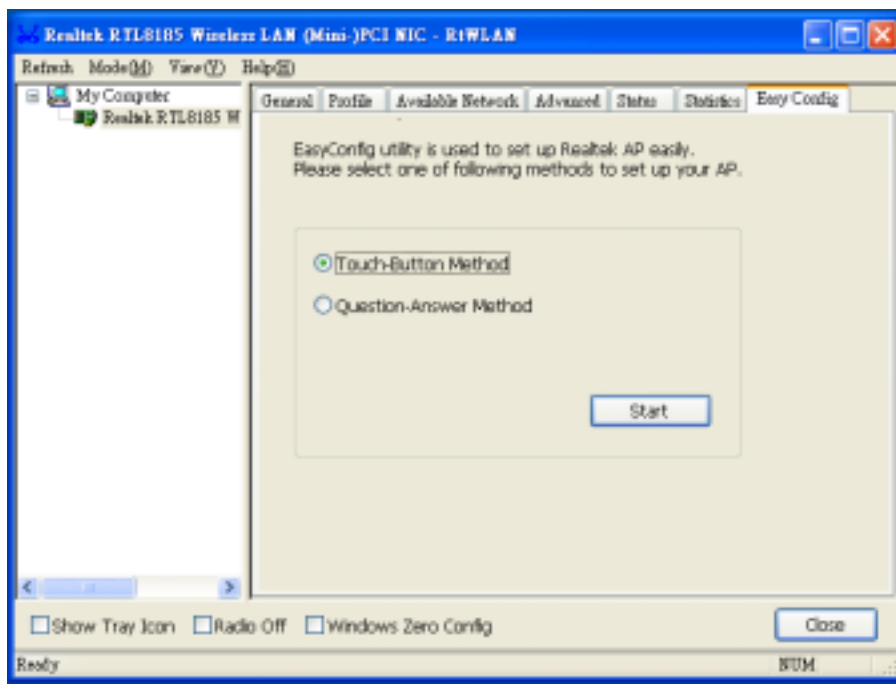

Figure 2

Here, you may select which method to use for EasyConfig. One is Touch-Button Method (**Button mode**), and the other one is Question-Answer Method (**Q&A mode**). If you select Touch-Button Method, and click “**Start**” button, then another Wizard window will be popped as shown in Figure-3 below:

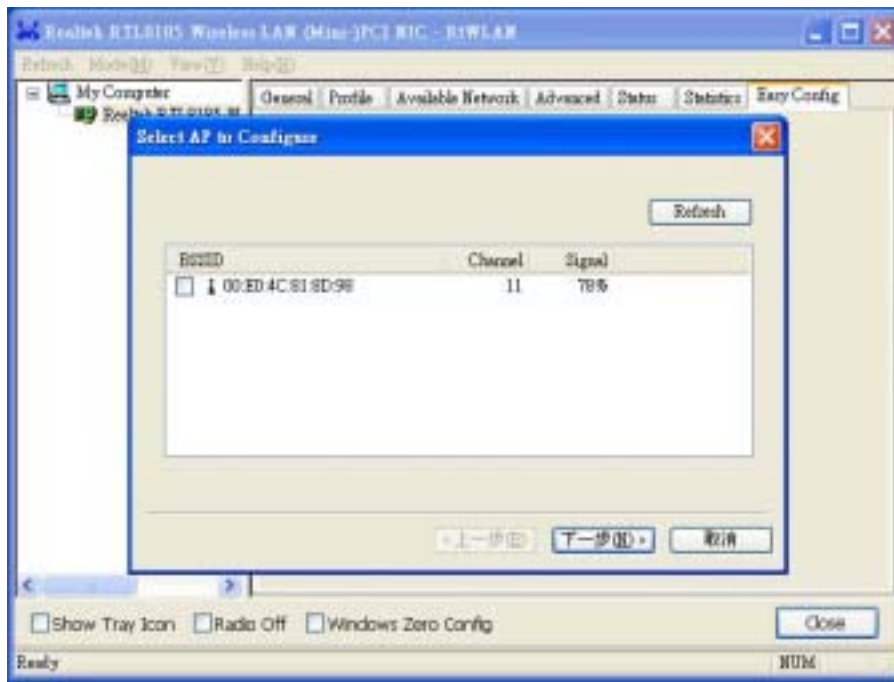

Figure 3

After “**Start**” is clicked, Utility program will try to scan Realtek EasyConfig AP, waiting for Button Mode request (i.e., The EasyConfig button has been pressed and the EasyConfig LED is blinking in AP). If any EasyConfig AP is found, it will be shown on the list table as above Figure-3. User should assert the checkbox on the list and click “**Next**” button to start the EasyConfig progress. Then, another window will be seen as in Figure-4.

Figure 4

Figure 5

Now, it will try to link EasyConfig AP and exchange settings. After it is done, you may see a successful message shown in Figure-5.

If Question-Answer mode is selected and “**Start**” button is clicked in Figure-2, a Wizard will be shown as Figure-6:

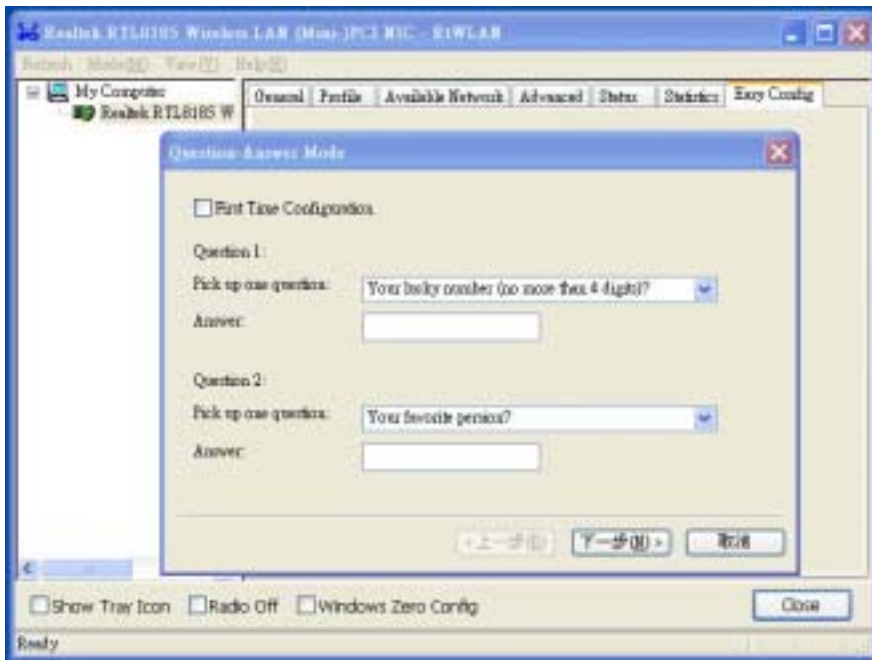

Figure 6

If the AP you to want to do EasyConfig has been installed with Q&A value, you must select the same question and input the same answer as the value used in its first time configuration. If it

is first time Q&A mode configuration for the AP, you should assert the checkbox of “**First Time Configuration**”, and then select the question to answer. You could input any answer as you like, but you should remember which question and answer you set for the other client configuration.

After answer is set and “**Next**” button is clicked, utility program will start to search EasyConfig AP with Q&A mode enabled. Then, the scan result will be shown as Figure-3. Click checkbox of AP you want to associate with and click “**Next**” button, it will link to AP and exchange the setting automatically as shown in Figure-6. After it is done, you may see a successful message as shown in Figure-7.

8186 Infrastructure-Client Operation

You may set WLAN AP as an infrastructure client in Basic setting page of web server. Then, go to EasyConfig page, you may see a figure shown in below:

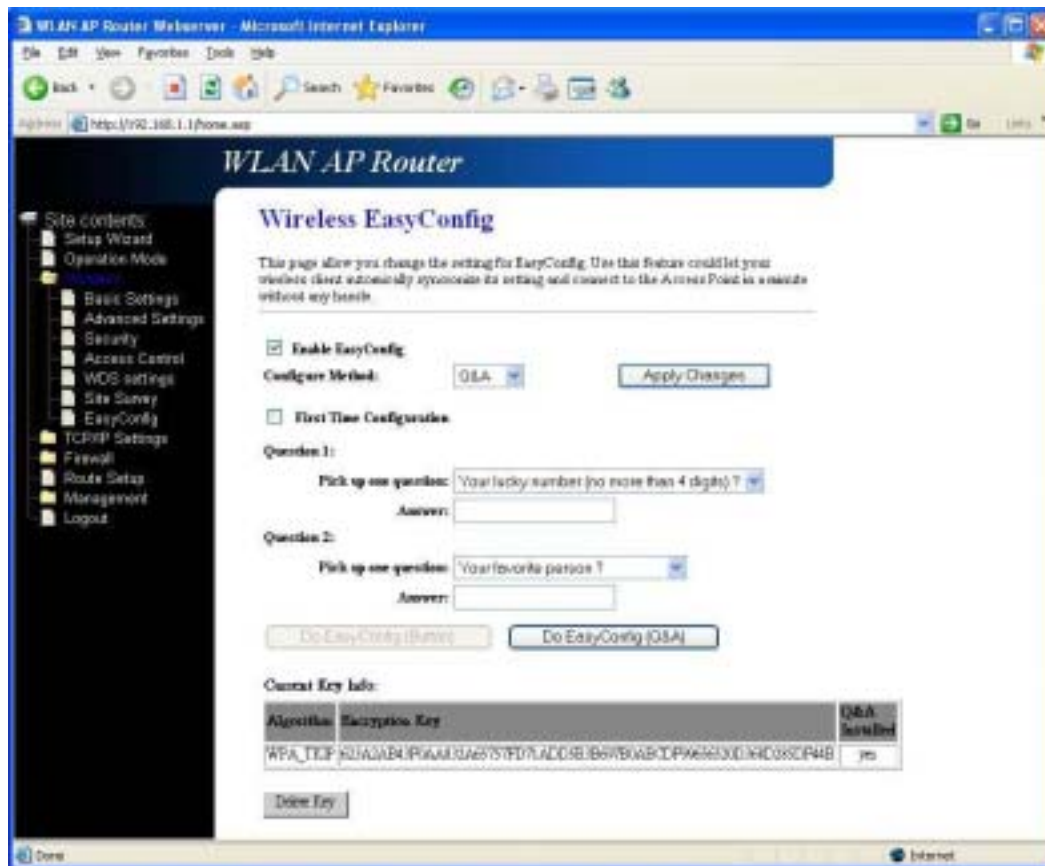

Figure 7

After EasyConfig is enabled, you may select which method to use (Button or Q&A). If Button mode is selected, user could push an EasyConfig button on 8186 evaluation board for 4-5 seconds. Then, EasyConfig LED will begin to blink. This operation is the same as in AP mode. If any EasyConfig AP is ready (AP EasyConfig LED is blinking) and found, the 8186 client will automatically negotiate the security policy with EasyConfig AP and adopt the setting when

EasyConfig is done. When the client has adopted EasyConfig the setting, the EasyConfig LED will be steady on. Except push button on evaluation board, user may enable the request by click **“Do EasyConfig (Button)”** on web page.

Beside Button mode, user may select Q&A mode for EasyConfig. If this is first time configuration of EasyConfig Q&A mode in AP (**“Q&A Installed”** item indicated as **“no”** in current key info table of AP EasyConfig web page), user must check **“First Time Configuration”** checkbox, and then input the answers for Question 1 and 2 in web page. After answers are given, click **“Do EasyConfig (Q&A)”** button, it will begin to search for EasyConfig Q&A mode AP. If any AP is found, the EasyConfig negotiation will be proceeded and the setting will be adopted automatically in AP and client when EasyConfig is done.

Please note, if it is first time configuration for Q&A mode, user must remember which question selected and which answer input because AP will save the client question and answer into Flash memory and check it when any other client requests Q&A mod EasyConfig hereafter.

8186 System Configuration

In this section, it will show you WLAN EasyConfig setting in config file. You could find this config file in 8186 CMK package, and you may edit the value as you want. Then, you could re-build the firmware image with the setting you modified, and upload it to WLAN evaluation board.

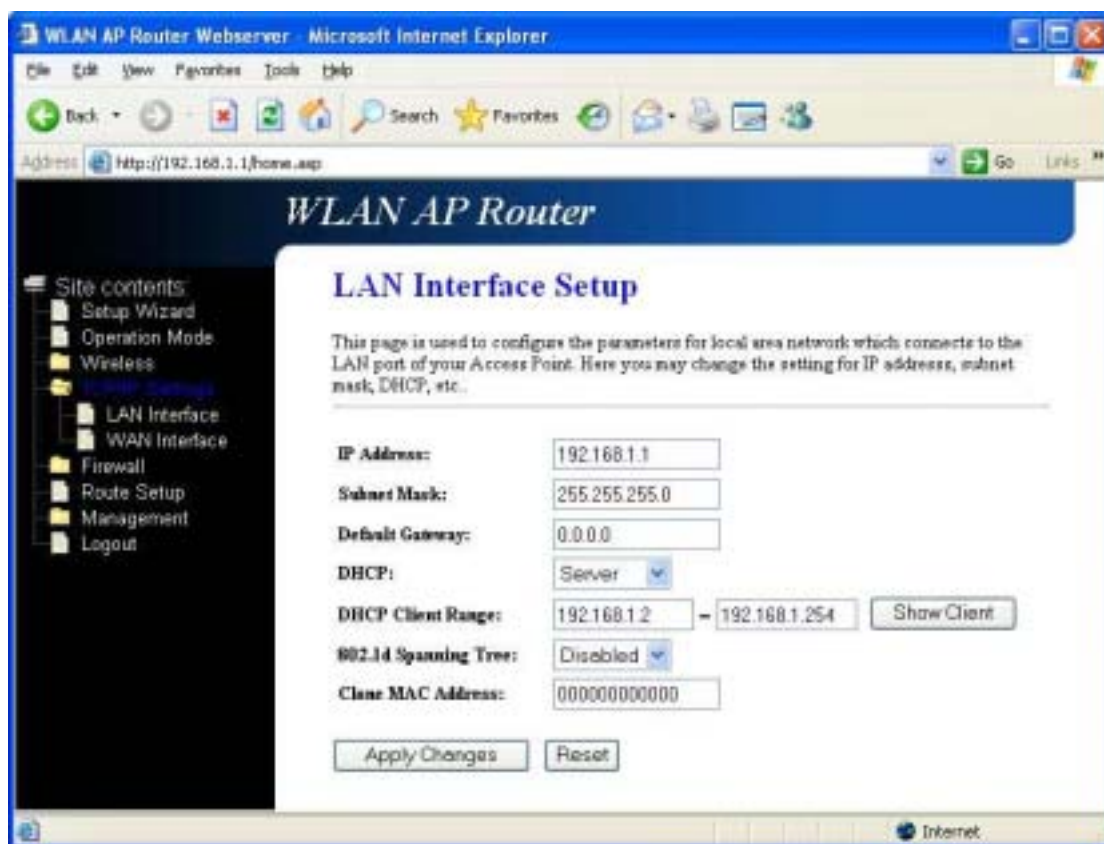

Keyword	Meaning	Value
DEF_WLANn_EASYCFG_ENABLED WLANn_EASYCFG_ENABLED	Enable/Disable EasyConfig	0 – disable, 1 – enable
DEF_WLANx_EASYCFG_MODE WLANn_EASYCFG_MODE	Indicate which configure method used	1 – button mode, 2 – QA mode, 3 – button+QA
DEF_WLANn_EASYCFG_ALG_REQ WLANn_EASYCFG_ALG_REQ	Indicate which encryption algorithm will be proposed when used in client mode	4 – WPA-TKIP, 32 –WPA2-AES
DEF_WLANn_EASYCFG_ALG_SUPP WLANn_EASYCFG_ALG_SUPP	Indicate which encryption algorithms could be accepted for client request	4 – WPA-TKIP, 32 –WPA2-AES, 36 – Both WPA-TKIP and WPA2-AES
DEF_WLANn_EASYCFG_SCAN_SSID WLANn_EASYCFG_SCAN_SSID	SSID used for EasyConfig. Please note, EasyConfig AP and client must be set with the same value	SSID text string up to 31 characters

Please note, DEF_XXX_XXX means these MIBs will be stored as default settings. Others will be saved as current setting. "WLANn_XXXX", where 'n' could be 0 or 1 represented as 1st and 2nd wlan interface. By default, 1st wlan interface will use the 8186 internal wlan controller, and 2nd interface will base on external wlan adapter through 8186 PCI interface.

3.5 TCP/IP Settings

3.5.1 LAN Interface

This page is used to configure the parameters for local area network which connects to the LAN port of your Access Point. Here you may change the setting for IP addresses, subnet mask, DHCP...etc.

3.5.2 WAN Interface

This page is used to configure the parameters for Internet network which connects to the WAN port of your Access Point. Here you may change the Access Method to static IP, PPPoE, PPTP or L2TP by click the item value of WAN Access Type.

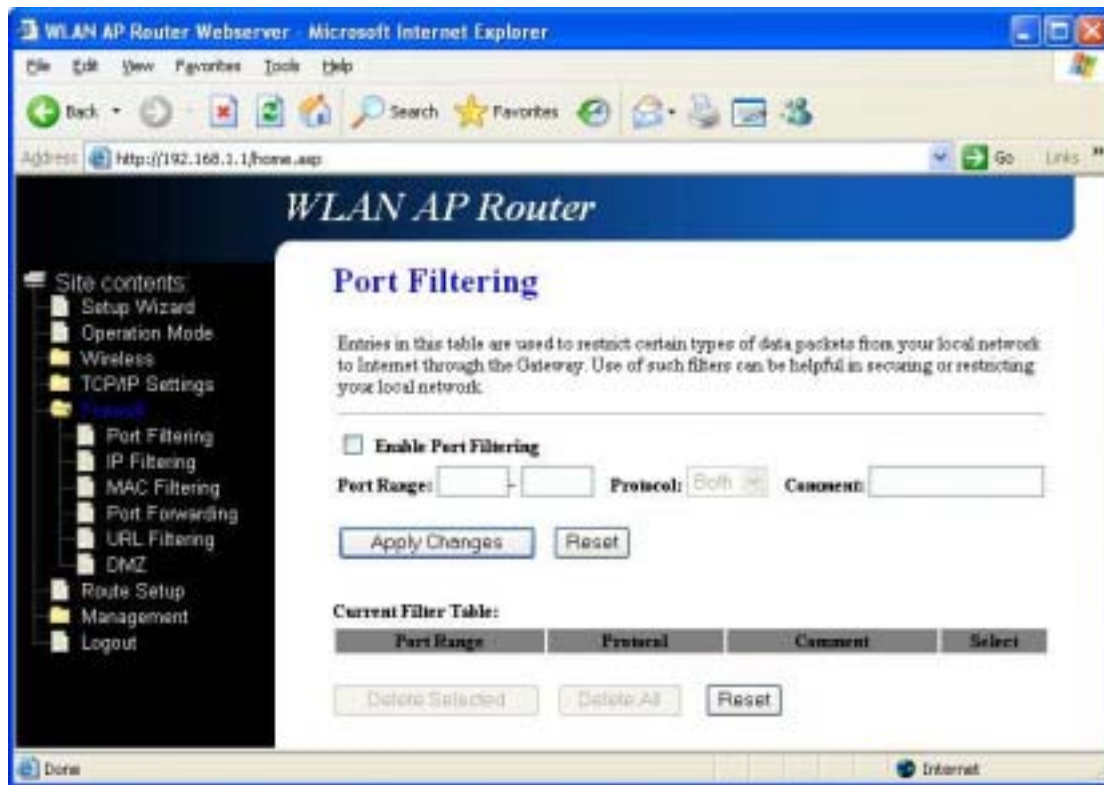

The screenshot shows the 'WAN Interface Setup' page of a WLAN AP Router webserver. The browser window title is 'WLAN AP Router Webserver - Microsoft Internet Explorer'. The address bar shows 'http://192.168.1.1/Phone.asp'. The page has a blue header with the text 'WLAN AP Router'. On the left, there is a 'Site contents' menu with items like 'Setup Wizard', 'Operation Mode', 'Wireless', 'LAN Interface', 'WAN Interface', 'Firewall', 'Route Setup', 'Management', and 'Logout'. The main content area is titled 'WAN Interface Setup' and contains the following configuration options:

- WAN Access Type:** A dropdown menu set to 'L2TP'.
- IP Address:** Text input field containing '61.1.1.2'.
- Subnet Mask:** Text input field containing '255.255.255.0'.
- Server IP Address:** Text input field containing '61.1.1.1'.
- User Name:** Text input field containing 'l2tp'.
- Password:** Text input field containing '*****'.
- MTU Size:** Text input field containing '1412', with '(1400-1492 bytes)' in smaller text to the right.
- DNS Settings:** Radio buttons for 'Attain DNS Automatically' (selected) and 'Set DNS Manually'. Below are three empty text input fields for 'DNS 1:', 'DNS 2:', and 'DNS 3:'.
- Clone MAC Address:** Text input field containing '000000000000'.
- Checkboxes:** A list of five unchecked checkboxes: 'Enable uPnP', 'Enable Web Server Access on WAN', 'Enable IPsec pass through on VPN connection', 'Enable PPTP pass through on VPN connection', and 'Enable L2TP pass through on VPN connection'.
- Buttons:** 'Apply Changes' and 'Reset' buttons at the bottom.

3.6 Firewall

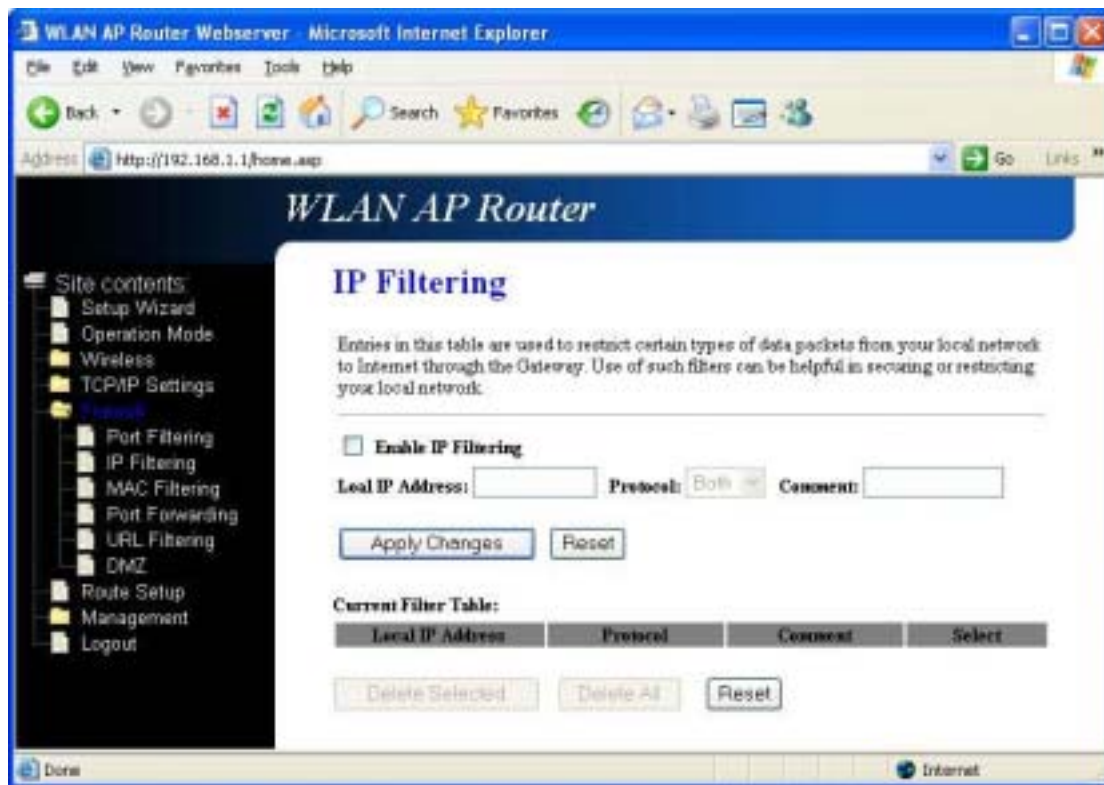

3.6.1 Port Filtering

Entries in this table are used to restrict certain types of data packets from your local network to Internet through the Gateway. Use of such filter can be helpful securing or restricting your local network.

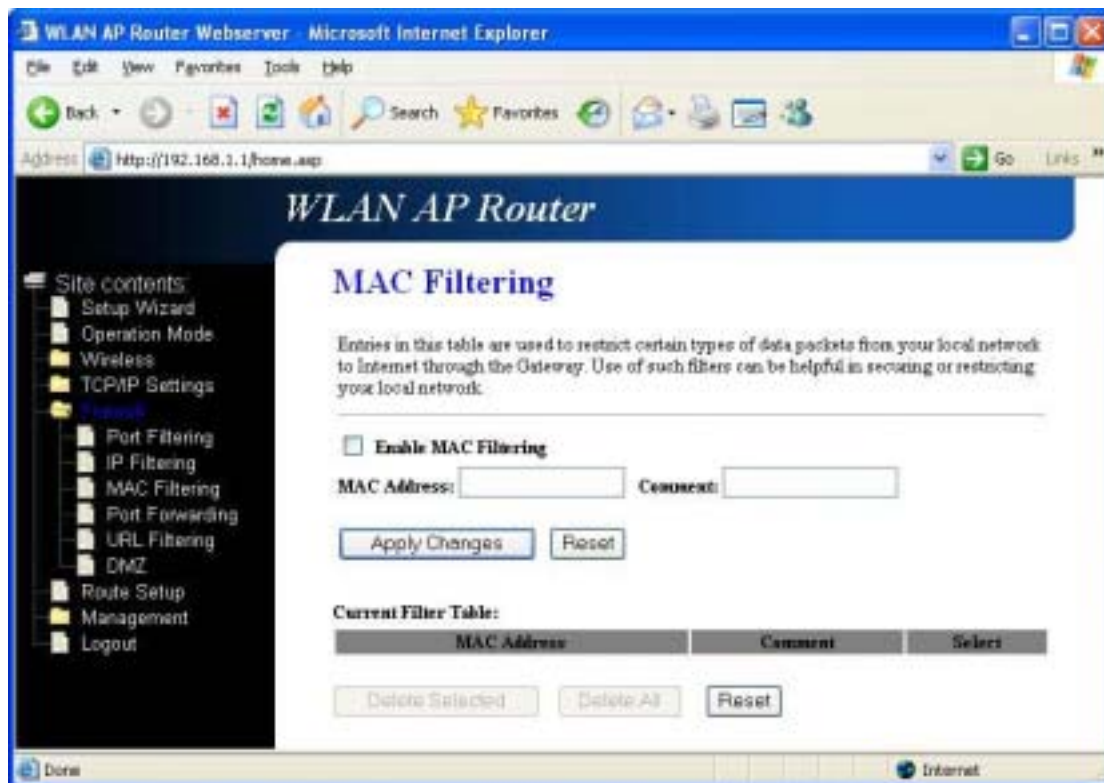

3.6.2 IP Filtering

Entries in this table are user to restrict certain types of data packets from your local network to Internet through the Gateway. Use of such filters can be helpful in securing or restricting your local network.

3.6.3 MAC Filtering

Entries in this table are user to restrict certain types of data packets from your local network to Internet through the Gateway. Use of such filters can be helpful in securing or restricting your local network.

3.6.4 Port Forwarding

Entries in this table allow you to automatically redirect common network services to a specific machine behind the NAT firewall. These settings are only necessary if you wish to host some sort of server like a web server or mail server on the private local network behind your Gateway's NAT firewall.

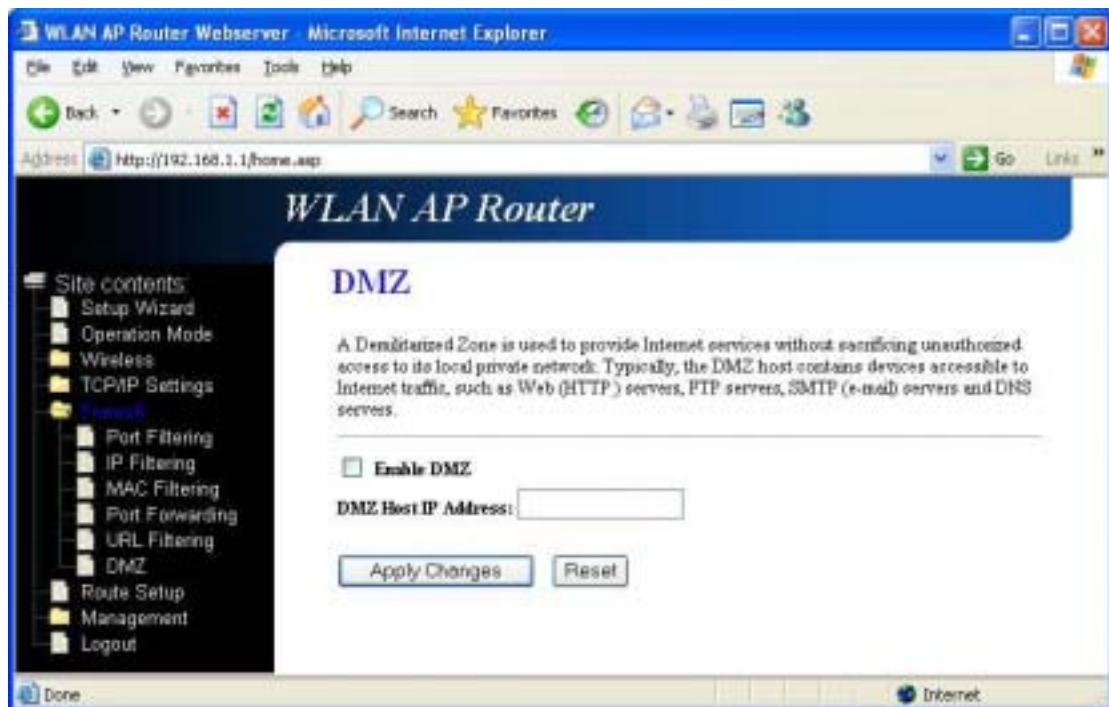

3.6.5 URL Filtering

URL filter is used to deny LAN users from accessing the internet. Block those URLs which contain keywords listed below.

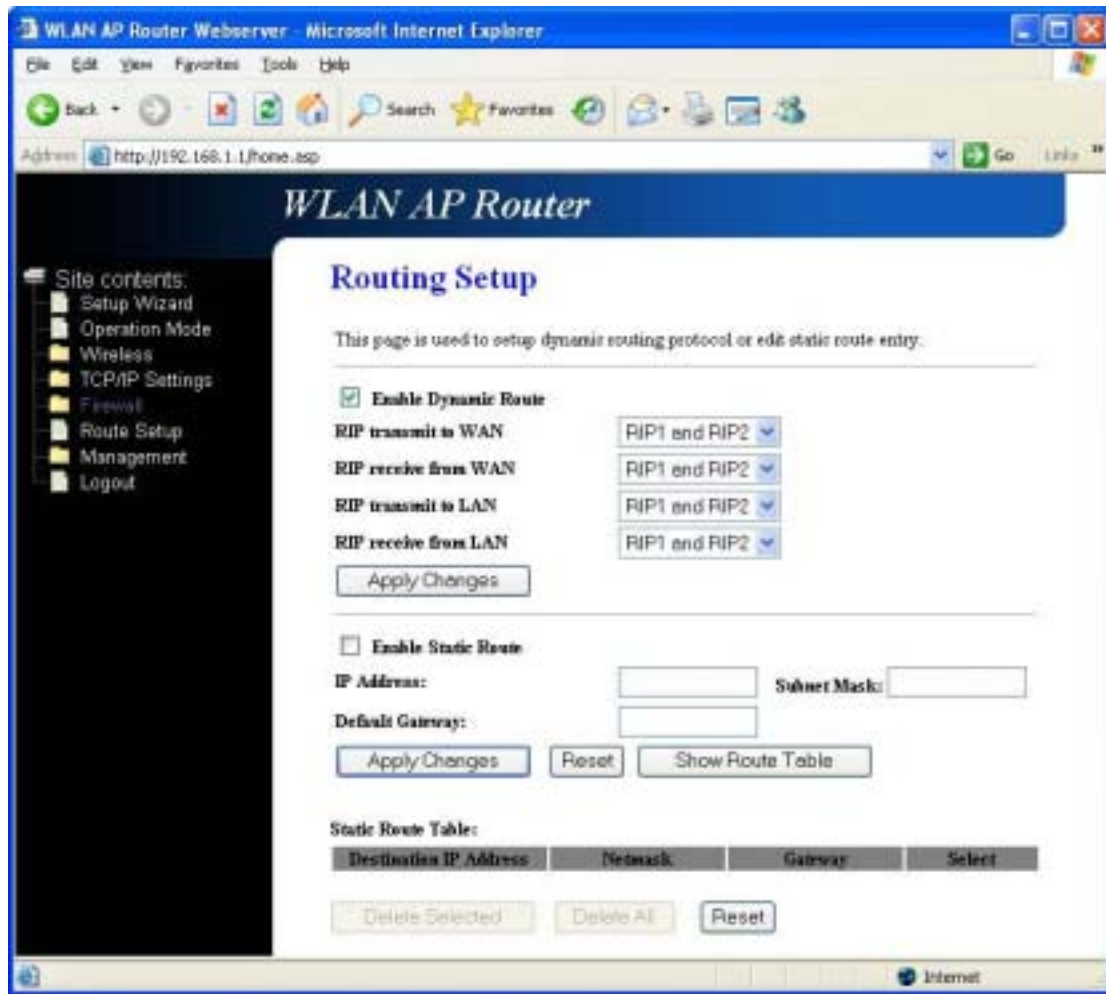

3.6.6 DMZ

A Demilitarized Zone is used to provide Internet service without sacrificing unauthorized access to its local private network. Typically, the DMZ host contains devices accessible to Internet traffic, such as Web (HTTP) servers, FTP servers, SMTP(e-mail) servers and DNS servers.

3.7 Route Setup

This page is used to setup dynamic routing protocol or edit static route entry.

3.8 Management

3.8.1 Status

This page shows the current status and some basic settings of the device, such as System information, Wireless Configuration, TCP/IP Configuration, and WAN Configuration.

The screenshot displays the 'WLAN AP Router Webserver' interface in Microsoft Internet Explorer. The browser's address bar shows 'http://192.168.1.1/home.asp'. The page title is 'WLAN AP Router'. A left-hand navigation menu lists various settings categories, with 'Status' selected. The main content area is titled 'Access Point Status' and includes a descriptive sentence: 'This page shows the current status and some basic settings of the device.' Below this, the status is presented in four sections: System, Wireless Configuration, TCP/IP Configuration, and WAN Configuration, each with a corresponding table of parameters.

System	
Uptime	0day/0h/31m/26s
Firmware Version	v1.3.9

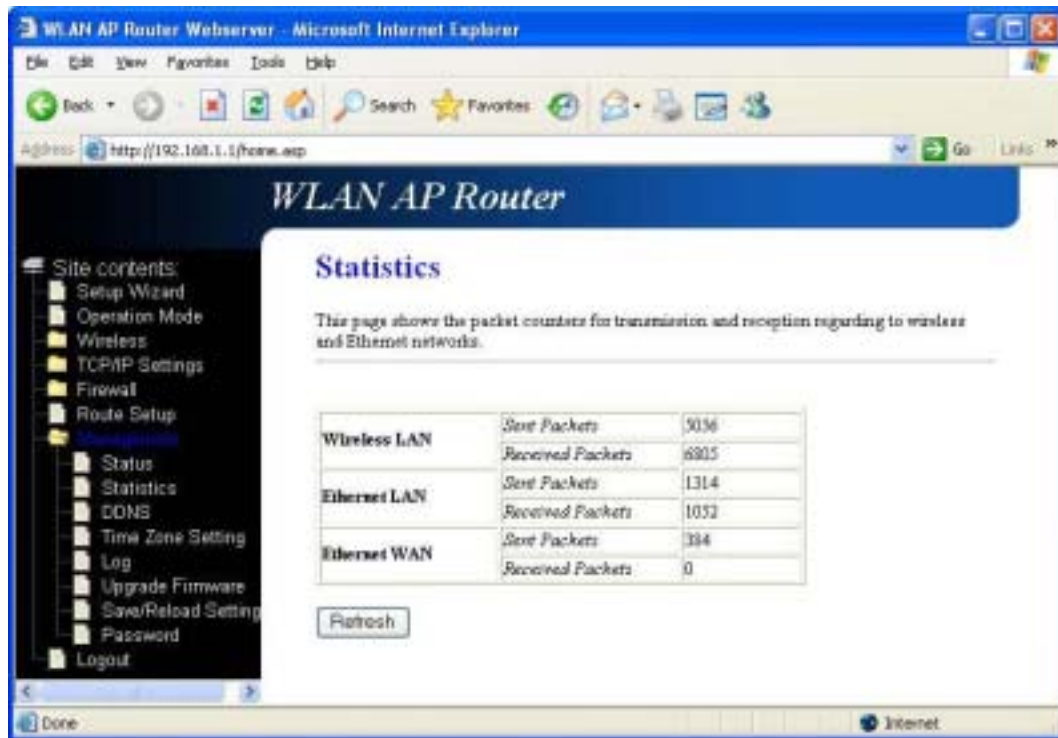

Wireless Configuration	
Mode	Infrastructure Client
Band	2.4 GHz (B+G)
SSID	Default_11G
Channel Number	9
Encryption	Disabled
BSSID	00:00:00:00:00:00
State	Scanning

TCP/IP Configuration	
Attain IP Protocol	Fixed IP
IP Address	192.168.1.1
Subnet Mask	255.255.255.0
Default Gateway	192.168.1.1
DHCP Server	Enabled
MAC Address	00:06:4f:bb:cc:dd

WAN Configuration	
Attain IP Protocol	L2TP Disconnected
IP Address	0.0.0.0
Subnet Mask	0.0.0.0
Default Gateway	0.0.0.0
MAC Address	00:06:4f:cc:cc:ed

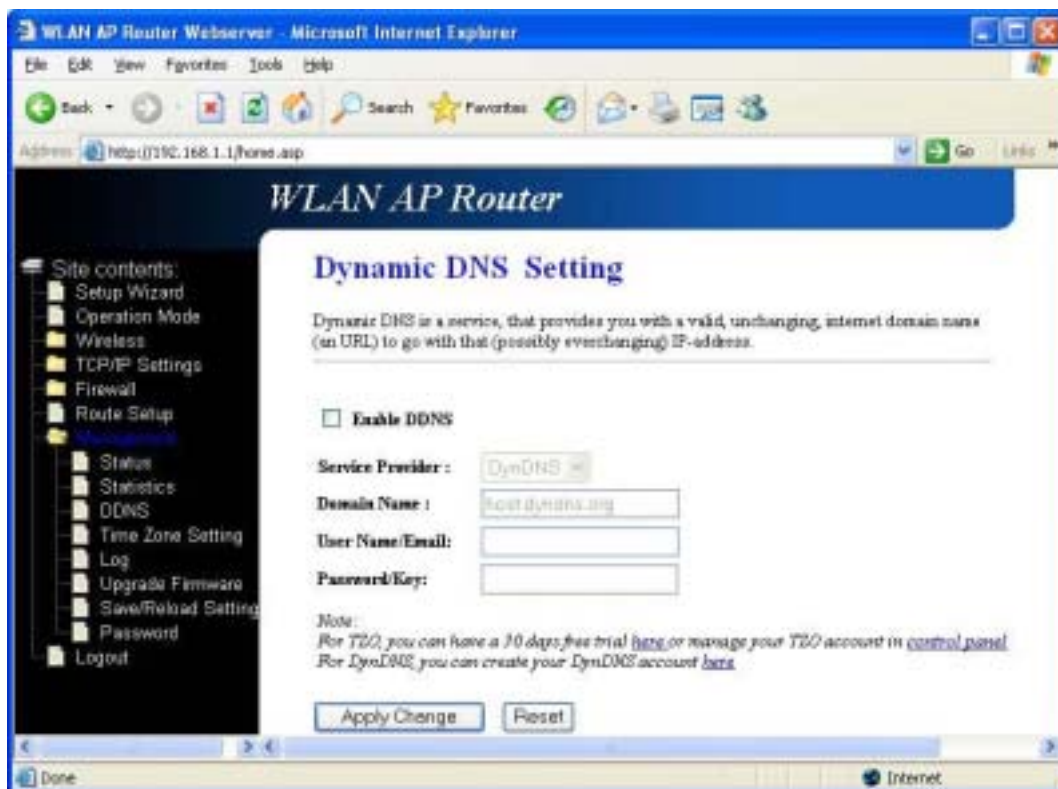

3.8.2 Statistics

This page shows the packet counters for transmission and reception regarding to wireless and Ethernet networks.

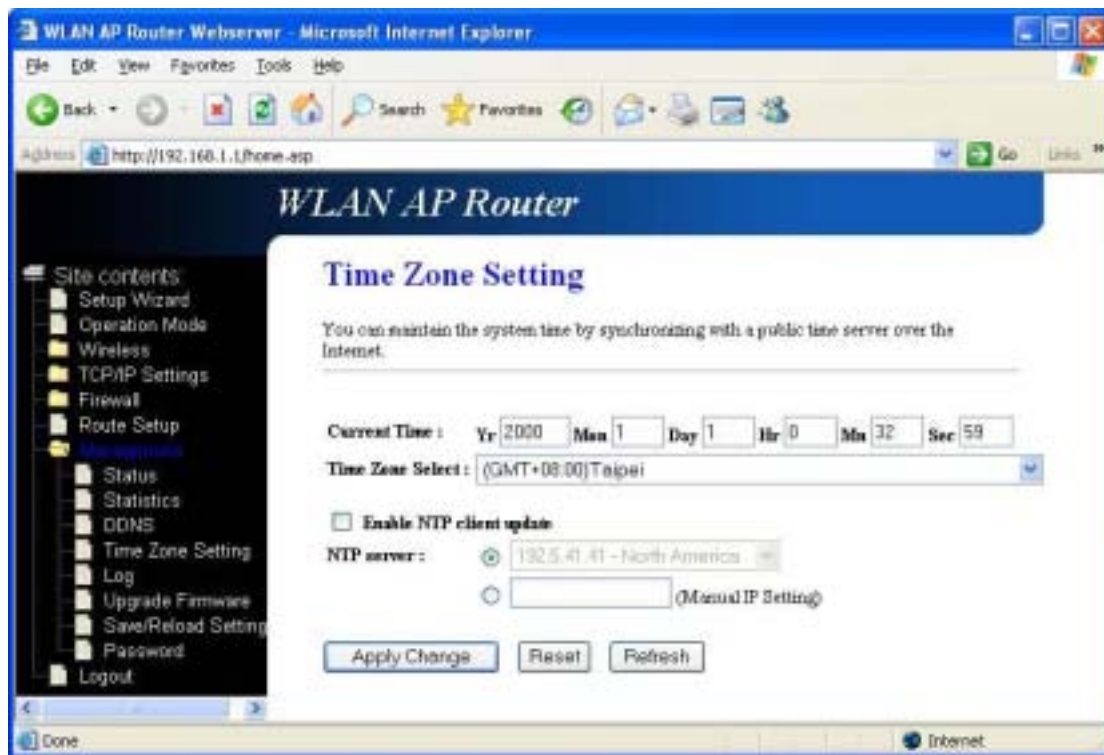

3.8.3 DDNS

Dynamic DNS is a service that provides you with a valid, unchanging, internet domain name (an URL) to go with that (possibly ever-changing) IP address.

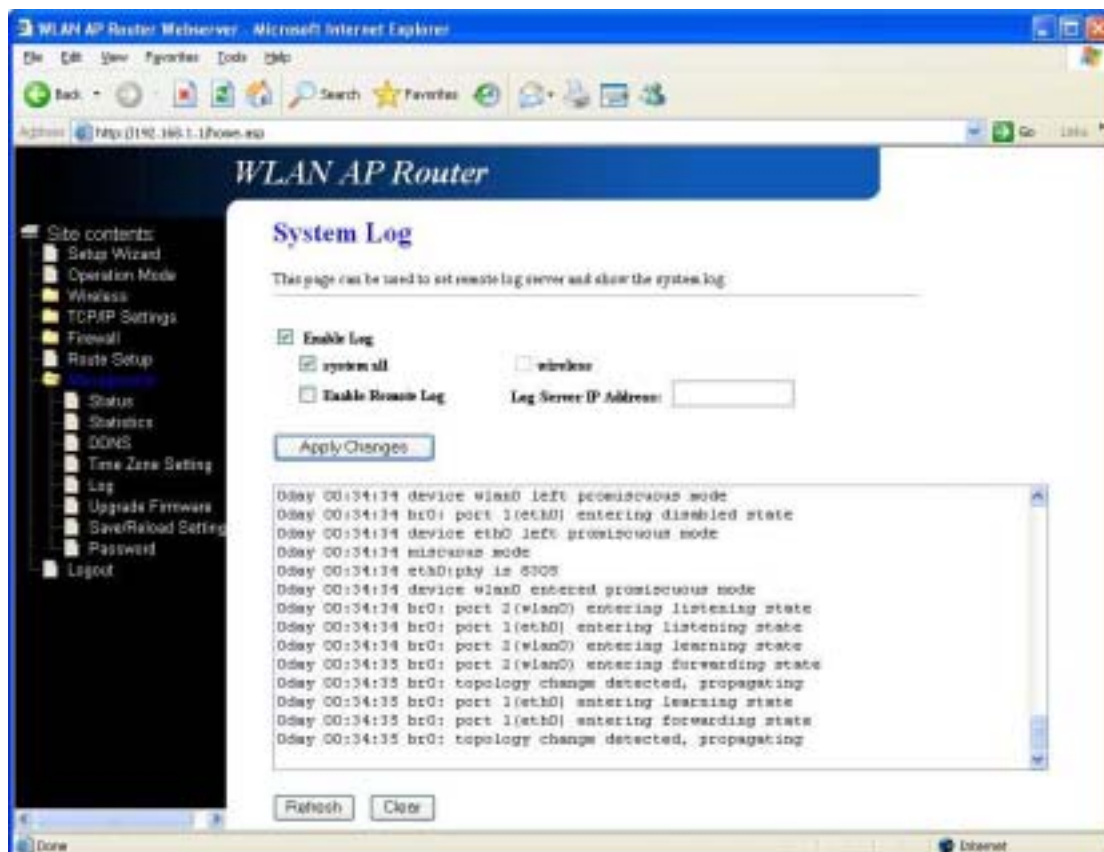

3.8.4 Time Zone Setting

You can maintain the system time by synchronizing with a public time server over the Internet.

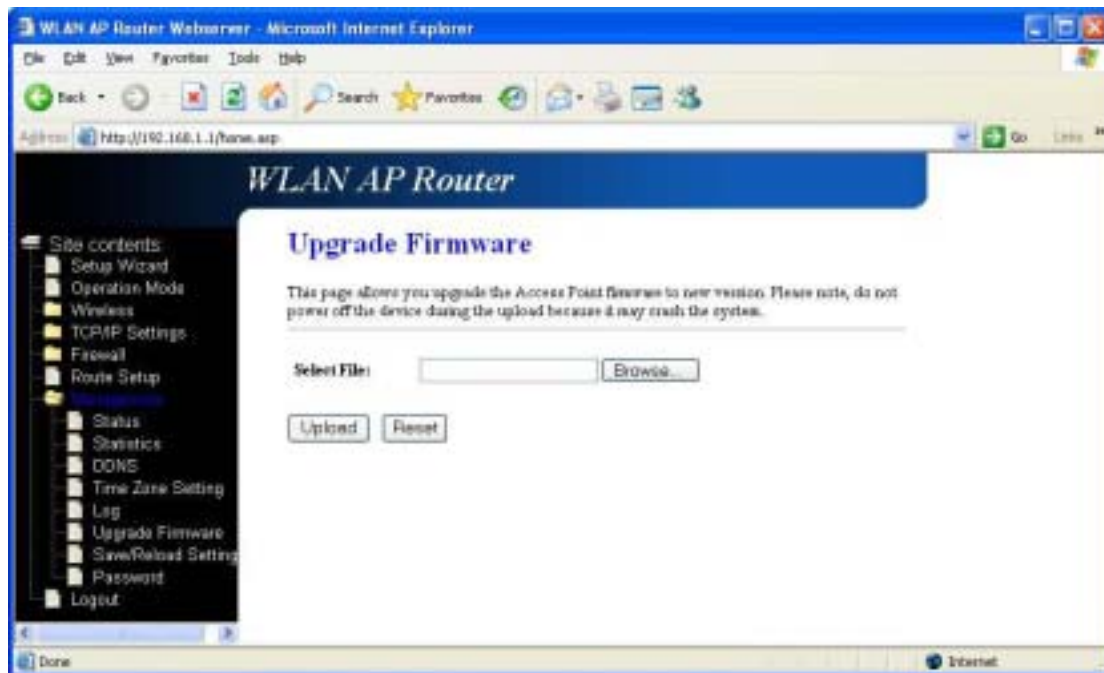

3.8.5 Log

This page can be used to set remote log server and show the system log.

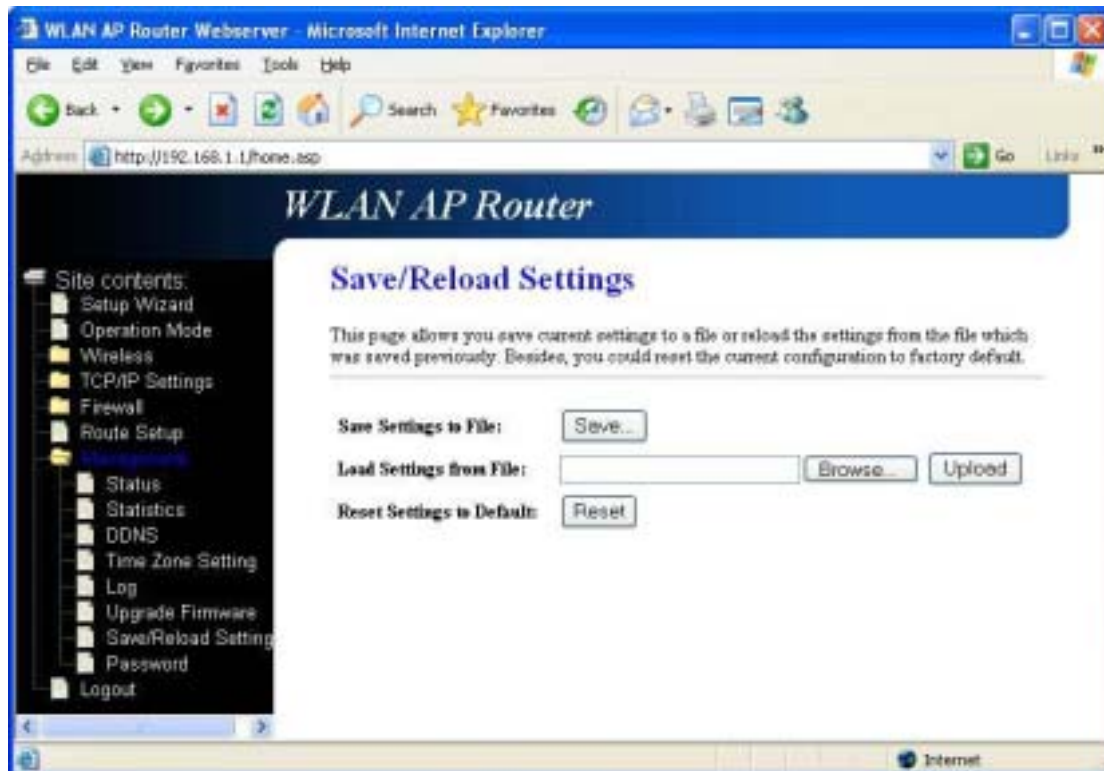

3.8.6 Upgrade Firmware

This page allows you upgrade the Access Point firmware to new version. Please note **DO NOT** power off the device during the upload because it may crash the system.

3.8.7 Save/Reload Setting

This page allows you save current settings to a file or reload the settings from the file which was saved previously. Besides, you could reset the current configuration to factory default.

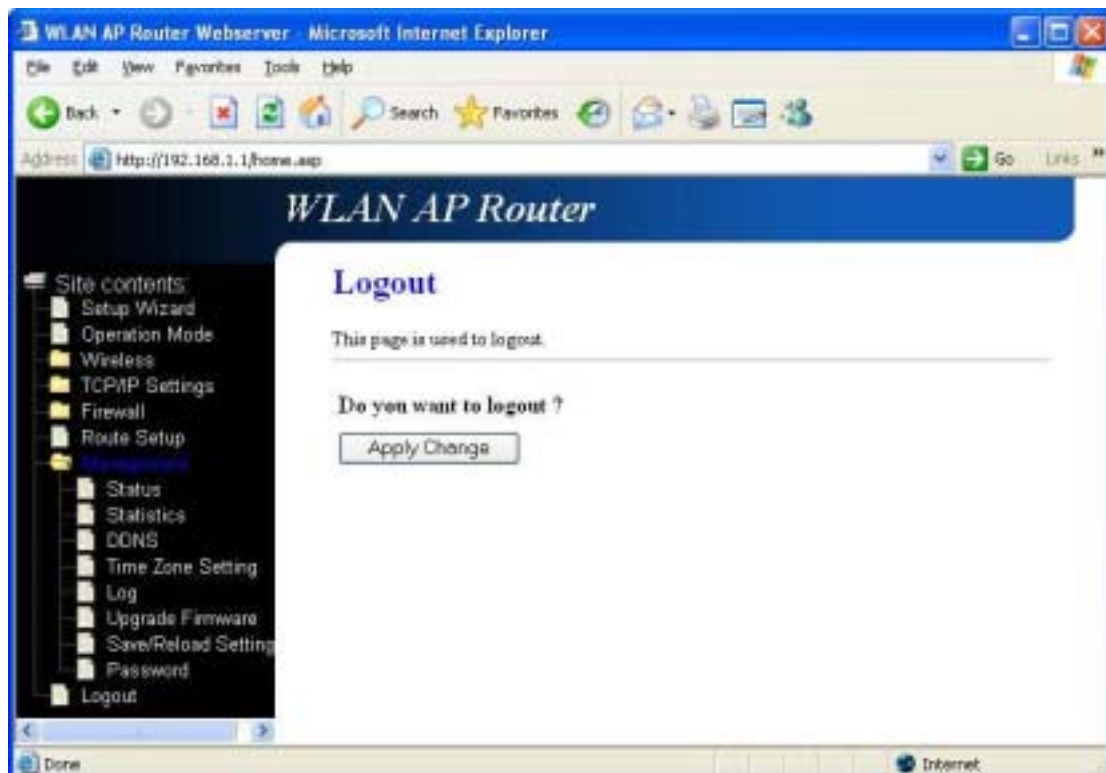

3.8.8 Password

This page is used to set the account to access the web server of Access Point. Empty user name and password will disable the protection.

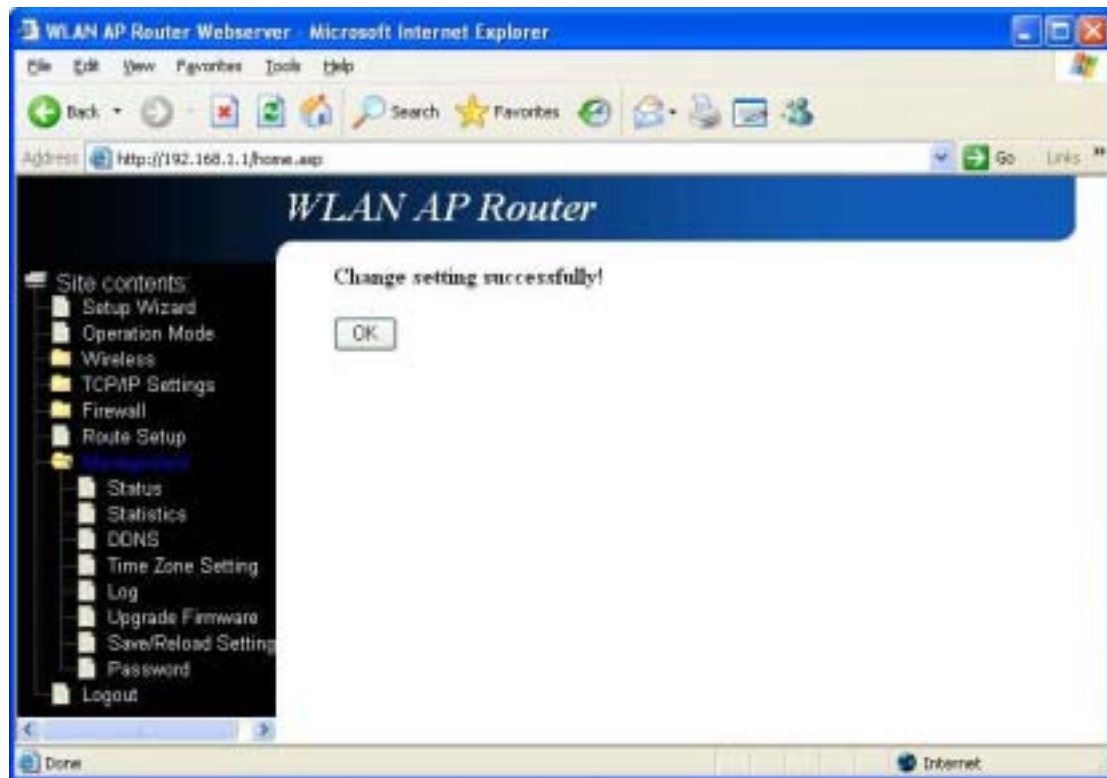

3.9 Logout

This page is used to logout WLAN AP Webserver.

Click “**Apply Change**” button to logout the webserver. And then, you will see the below screen:

4 Troubleshooting

This chapter covers some common problems that user may encounter while accessing the wireless router and some possible solutions for them. If you follow the suggested instructions to configure the wireless router, but router still does not function properly, please contact your local dealer for assistance.

Q1) **Can not connect to the wireless router.**

Ans: Check the following.

- a) If the wireless router is properly installed, if LAN connections are OK, and if wireless Router is powered on.
- b) Ensure that your PC and wireless router are on the same network segment.
- c) If your PC is set to "Obtain an IP Address automatically" (DHCP client), restart it.
- d) If your PC uses a Fixed (Static) IP address, ensure that it is using an IP Address within the range **192.168.1.2** to **192.168.1.254** and thus compatible with the wireless router's default IP Address of **192.168.1.1**. Also, the Network Mask should be set to **255.255.255.0** to match the wireless router. In Windows, you can check these settings by using "**Control Panel → Network**" to check the "**Properties**" for the TCP/IP protocol.

Q2) **When I enter a URL or IP address I get a timed out error.**

Ans: A number of things could be causing this. Try the following troubleshooting steps.

- a) Check if other PCs work. If they do, ensure that your PCs IP settings are correct. If using a fixed (static) IP address, check the Network Mask, Default gateway, and DNS as well as the IP Address.
- b) If the PCs are configured correctly, but still not working, check the wireless router. Ensure that it is connected and on. Connect to it and check its settings. If you can't connect to it, check the LAN and power connections.
- c) If the wireless router is configured correctly, check your Internet connection (DSL/cable modem etc) to see that it is working correctly.

Q3) **Some applications do not run properly when using the wireless router.**

Ans: The wireless router processes the data passing through it, so it is not transparent.

Use the Special Applications feature to allow the use of Internet applications that do not function correctly. For example, you can use DMZ function, this should work with almost every application but there is a security risk since firewall is disabled and only one PC can be used in this feature.

Q4) My PC can not locate the wireless router.

Ans: Check the following.

- a) If your PC is set to Infrastructure Mode, because the router is always in Infrastructure Mode.
- b) If the SSID on your PC and wireless router are the same. Remember that the SSID is case-sensitive.
- c) If both of your PC and wireless router have the same WEP settings. The default setting for the wireless router is disabled, so your wireless station should also have WEP disabled.
- d) If WEP is enabled on the wireless router, your PC must have WEP enabled, and the key tables (64/128 bit encryption) must match.
- e) If the wireless router's wireless screen is set to allow LAN access to select wireless stations only, then each of your wireless stations must have been selected or access will be blocked.
- f) To see if radio interference is causing a problem, check if connection is possible when close to the wireless router. Remember that the transmission range can be as short as 100 feet in poor environment.

Q5) Wireless connection speed is very slow.

Ans: A wireless system transmission speed depends on the distance and the environment.

To obtain the highest possible connection speed, you can try the followings:

- a) Try to adjust wireless router location and orientation.
- b) If there are interference problems, change to another wireless channel.
- c) If other devices cause the interference, you should turn off that device or relocate it.

Q6) The "Status" light is ON (steady Green) after power on, it means the router is hung

Ans : Please disconnect the power adapter from the power jack on the router and reconnect the power adapter again to the router, check if the "Status" light is flashing normally.
